The Digit Hunters. In the second century BCE, during Archimedes's lifetime, the Hindu-Arabic numeration system was still more than a thousand years in the www.enganchecubano.com Archimedes had to do all his calculations in a strange hybrid of the Babylonian sexagesimal (base 60) system and the Greek system, in which each letter of the alphabet had a numerical value (alpha = 1, beta = 2, and so on).

Kevin Wilson Posted on: Sub-zero temperatures can make the outdoors a miserable place to be. Add wind and humidity to the equation, and things get nasty. Sure you can always hunt a heated blind, but if you need to brave the elements, some planning is in order. Gear up properly and the cold can be manageable. Venture out unprepared and you may as well write off your hunt. Across the continent outdoorsmen hunt under a variety of conditions. In the southern states heat and humidity present a different challenge. Hunt the far northern states and provinces the snow and cold is a different story altogether. The only way I survived was by layering with the proper clothing, understanding my limitations, and persevering. For those with the right gear, plenty of perseverance and most importantly an insatiable desire to conquer the elements, hunting out in the cold can not only produce trophy-class deer, but also an immense sense of accomplishment. Learning to identify limits and strategies to cope with the cold can mean the difference between success and a dismally uncomfortable hunt Whether you are a stand hunter or you like to hunt on the move, the key to staying warm is maintaining blood flow. With many sub-zero days on stand to my credit, I can say from first-hand experience that staying limber is the biggest challenge confronting hunters. The problem with stand hunting is dormancy. No longer are we as focused, let alone able to aim and shoot accurately. To stay limber and sharp on stand, experienced hunters carefully and cautiously execute subtle, but beneficial exercises. The worst thing you can do is stay motionless for hours on end. By standing up, slowly bending and flexing all joints and tensing then releasing muscles, one can literally generate and retain warmth. Remember, by staying warm and comfortable, other senses are heightened and focus can be directed toward scanning for deer. With a reasonable amount of clothing most hunters are able to endure an all day sit simply by applying mind-over-matter. We all want to be comfortable and we want to enjoy the hunt. Even in extreme cold, most hunters can cope with a three to four-hour sit. The first step to conquering the cold is to dress properly. With the many commercial super-fibers available today, it comes down to choice and application. As an Alberta resident accustomed to coping with dramatic temperature extremes, experience has proven the best way to beat the cold is to layer up. Beginning with the layer closest to the skin, in my opinion one of the best insulating liners on the market today is Underarmour www. Alternatively, still very effective is polypropylene. These and other hi-tech alternatives serve to insulate and wick moisture away from the skin. As most of us can attest to, overheating on the way to our stand or as we still-hunt our way through the woods can be a big problem regardless of how cold it is. If you have a long way to walk to your stand site, it may be best to minimize your clothing and carry a pack containing proper garb to put on when you arrive. It was on a trip to the Northwest Territories a few years back when an outfitter took me into a supply store and introduced me to Helly Hansen garments www. Bar none, their line of fiber pile has revolutionized my cold-weather hunting. Again, while there are many good alternatives on the market, for me no other sweater or jacket has proven as effective in retaining body heat. When temperatures are really low and the weatherman is forecasting wind, I add another layer of tight woven wool pants as added insulation. Then for the final touch, I wear a full camouflage suit complete with hooded parka and insulated coveralls. Gloves, mittens or a muff are critical in cold weather. I favor wool mitts almost exclusively, particularly the kind with the flip-open fingertips. Accessibility to shooting fingers is very important when using a bow or a firearm. If severe temperatures are immanent and the wind chill high, then using the wool as a liner and adding a Thinsulate™ or leather cover mitt can be just the ticket. With the majority of body heat lost through your head, a wool hat and, if necessary, a balaclava are a must. Although not camouflaged, Helly Hansen makes an exceptional product that many folks in the far north swear by; it has thick pile insulation and a heavy nylon outer shell for blocking the wind. Aside from headgear, footwear too, is critical. Wearing a liner sock and wool in either of these keeps me my feet warm even on the coldest days.

Northern whitetail hunters know this scenario all-too-well. As a rule cold-weather hunting often equates to exercising willpower. To put it bluntly, we cope with the elements as a means to an end. Remember, dressing properly can take the edge off the cold and add extra comfort, but nature shows no mercy. The bottom line - hi tech clothing has its limitations, and that means you need to employ other strategies to help you stay focused in the cold. For instance, if I can sit from 7: Extreme cold causes your body to burn more calories, so eating regularly can help deflect the discomfort. Likewise, lunch is a reward for making it until noon, and so on. A hot thermos with coffee or hot chocolate can make all the difference in the world when it comes to toughing it out. No one ever said hunting in the extreme cold was a cake walk. Only by persevering and putting in your time will you get the job done. Confessing an obsession for big whitetails and bighorn sheep, he has hunted most North American big game species with either bow, muzzleloader, rifle or shotgun. Specializing in archery, freshwater fishing, waterfowl and big game hunting, his articles can be found in several well known outdoor publications across the U. Mikey established the Xros Heart basketball team consisting of himself, Ewan, and his classmate named Tagiru Akashi. One day, Tagiru discovers a strange and unstable realm in-between the human and digital worlds called the DigiQuartz. The DigiQuartz is where Fusion Loader wielding children known as Digimon Hunters hunt down and capture Digimon that escape from the Digital World to feed off the negative emotions of humans. Given a Fusion Loader by a strange old man and accompanied by a Digimon named Gumdramon, Tagiru, along with Mikey, Ewan and their Digimon, join the Digimon Hunt to investigate and protect their world from rampant Digimon while clashing against rival hunters. To fight the threat, the Clock Store Owner traveled through time and space to summon the eight original Digidestined, the four new Digidestined, the Digimon Tamers, the Legendary Digimon Warriors, and the operatives of DATS from their different universes to fend off Quartzmon alongside the reunited Fusion Fighter Army. Though a Hunter named Ryouma wins the Brave Snatcher, he is revealed as a tool by Quartzmon in the form of his partner Astamon. With Quartzmon defeated, the balance between the Human and Digital Worlds is restored, with the Digimon returning to the Digital World while the heroes are sent back to their universes. In the occasion, Mikey confirms his suspicion that the Clock Store Owner is actually the reincarnation of Bagramon, who has now dedicated himself to protect the human and Digital Worlds. However, the third season was rushed, with Yukio Kaizawa as the main writer. Instead, Yu remained as a protagonist due to his character still needing growth. Digit is also one of the most trusted names when it comes to technology reviews and buying advice and is home to the Digit Test Lab, India's most proficient center for testing and reviewing.

Among other tasks, the orbiter was to serve as a communications relay for the Mars Polar Lander mission, which failed for unknown reasons in December. Several investigating panels were convened to determine what allowed the error to go undetected, but as of , NASA was still trying to figure out what caused the failure of the Mars Polar Lander. The American Bankers Association claimed it was the largest such error in banking history. Moral of the story: No Monkeying Around The software lifecycle begins when an application is first conceived and ends when it is no longer in use. Among the various stages, test planning, testing, and re-testing are therefore vital. Software Testing has come a long way from the days of "monkey testing. In the early days of mainframes, and later on with the PC, it was thought that if a monkey entered all sorts of random input sequences, hidden bugs in the software would be found. As if real users would behave like monkeys instead of doing their routine work! Apart from the typical opportunities in development firms, testing is an area where considerable outsourcing action is projected. Also, QA is often the starting point for many clients, as there is less apprehension about Intellectual Property violation. Also, the kind of tasks now coming to India are high-end enterprise software and mission-critical applications. This has seen high performers. They also offer paid internships to final-year students of tier I and tier II engineering colleges, and later on absorb most of the candidates. At other levels of entry, Agarwal mentions Mercury Certified Professionals as being in high demand. Fun And Games With the increased deployment of IT systems in manufacturing and healthcare, software testing is set to get a fillip. The gaming industry is another prospect. Game lovers have never had it better: Types Of Testing Regression Testing Re-testing of a software system that has been modified to ensure that no previously working functions have failed as a result of the reparations, and that the newly added features will not create problems with previous versions. White Box Testing Unlike black box testing, white box testing uses specific knowledge of programming code to examine outputs. Defect and Change Tracking A defect tracking tool is a database of bug reports, with a front-end that facilitates actions such as changing the state to reflect the progress of the work done. A change-tracking system is an editable database containing information included in document revisions. Memory Leak A memory leak is unnecessary memory consumption by a program. The most common manifestation is the failure to release unused memory that has been allocated by the operating system. Software Configuration Management SCM The collection of processes and tools that are used to effectively manage the development, maintenance, and build processes of software. The Requirements We ask her about the qualities one looks for in an aspirant. While developers are concerned with the depth of an application, for a QA person it is the breadth. Good communication skills are vital to convince the developer-who can be passionate about his output-of the need for alterations in functionality. A lot of testers these days do not stop at simply reporting bugs; they try to pin-point the problem. Performance testing finds out how the software will perform under reasonable as well as unreasonable loads. Security testing aims to discover vulnerabilities in the software that might allow hackers to steal information or cripple its function. Accessibility testing verifies that people with physical handicaps can use the software without problems. Joshi advises, "Anyone who wants to build a career in testing should explore some of these areas. Salgia says, "Good testers in these two domains are a rare breed. We have a tough time finding a white box tester. You look for clues, get into the mind of the programmer, try to re-trace his footsteps, use tools to study evidence, and find that evasive bug. And while at it, also build a lucrative career.

These are basically designed to be attached to rifles or crossbows or any other weapons. These consist of reticle systems. Similar to other night vision devices, these scopes vary according to the different Generations, ranging from Gen 1 to Gen 4. Furthermore, digital night vision scope devices also occupy top positions in terms of quality and price. A night vision scope is a great tool for hunters and shooters. Night Binoculars Night Vision Binoculars are another popular type of night vision devices. Instead, they are pretty much used by holding them in front of the eyes, much like a regular set of binoculars. Night vision binoculars work by magnifying an image and amplifying the amount of light in the image. This enables the user to see more clearly even in very low light conditions. They also have other limitations, for instance, that they can only offer you a quality night view until a certain distance. Most binoculars come with 2X image magnification. If used to view over exceptionally long distances, the binoculars may deliver a blurred result and will not be useful. The best use of night vision binoculars is for viewing in low-light conditions over a distance with the viewer stationary. We have an in deep guide article about this device with title: Just check it to find the best fit for you. Also, if you need multi-purpose vision binoculars, day and night vision binoculars are the options you should aim for. Night Monocular A night vision monocular device shares similarities with night vision binoculars as well as night vision scopes. A night vision monocular basically has a single eyepiece. It is through this eyepiece that the viewer is able to get a clearer night vision. Monocular devices amplify light so that even in low-light conditions, the viewer is able to get a clearer picture of the objects. Steven Hooper Much like night vision binoculars, night vision monocular devices are also handheld and can only be used effectively when the user holds it in front of his eyes while stationary. Night vision scopes are closely related to monocular devices. In fact, a monocular device that is designed to be able to mount on top of firearms such as rifles is known as a scope, or more specifically as a rifle scope. You can find more about night monocular at this our article 10 best night vision monocular Night Goggles Night vision goggles are a type of night vision devices. Instead, most night vision goggles come with headgear so that you can easily use them while in motion. This makes them perfect for such scenarios where you need night vision on the go, such as searching the game at night or going on a rescue mission in low-light circumstances. Unlike many other night vision devices, goggles do not magnify the image to improve visibility at night. Instead, the goggles make use of intensifier tubes to enable you to see objects at night. Some night goggles use individual tubes in each eyepiece while others offer the same image through both eyepieces using a single intensifier tube. Most night vision goggles come with sophisticated headgear or basic straps. Depending on your needs, you can choose the one or the other. A headgear or even the straps allow you to adjust night vision goggles in front of your eyes without having to hold them all the time. This leaves your hands free and you can easily use the night vision goggles while in motion.

Millions of Digits of Pi For most people, knowing the value of pi (π) to two decimal places is enough, this ratio of a circle's circumference to its diameter may need to be known correct to 10 or 15 decimal places, but rarely more.

First, you can eliminate moving parts, including the reticle itself, avoiding the possibility of reticle movement that could alter your zero. For low-light shooting, you can boost the brightness and contrast of the image. You can even hook up the scope to a remote monitor so an instructor or spotter can see exactly what the shooter is seeing. Last but not least, everything viewed through the scope can be digitally recorded for later playback and analysis. This way a hunter can record, for posterity, the moment he bagged a trophy buck. Or, a military sniper can record a complete target engagement, for later review by his commander and fellow marksmen. Magnification is accomplished electronically, and the aiming point does not change at all during magnification. The electronic magnification is parallax-free and the exit pupil remains constant, allowing easy target acquisition, even at high power. Elcan claims that resolution does not change significantly from wide field of view to narrow field of view. Electronic Ballistic Compensation One of the most useful features of the Digital Hunter is electronic ballistic compensation. The scope has a USB port to connect with a computer. All the critical calculations are handled automatically. Watch the video below to see how this all works. Utilizing the near infrared means more light energy is available to the scope for better, brighter imaging. After dark, active night vision enables covert surveillance and varmint hunting where legal. The effective range of the active night vision depends on the power of the IR Flashlight s. The software calculated bullet drop and the information was stored in a computer chip inside the scope. The only two drawbacks I could find were price and weight. Mauldin said physically challenged hunters are particularly excited about the Digital Hunter. It can be used with a video monitoring screen so the rifle can be sighted without your eye to the scope. But consider this "all you really need on top of the rifle is the lens system with light sensor. In fact, the control functions and display could even be performed by an iPod or smartphone. With the iPod you could select the reticle, input ballistics data Velocity, Bullet BC, Wind direction, and select the magnification level. And with a finger-tap on the screen you can record the entire match you are shooting.

Presentation[edit] Patients exhibiting an ulnar claw are also very frequently unable to spread abduct or pull together adduct the fingers against resistance. This occurs because the ulnar nerve also innervates the palmar and dorsal interossei of the hand. Patients with this deficit will become increasingly easy to identify over time as the paralysed first dorsal interosseous muscle atrophies, leaving a prominent hollowing between the thumb and forefinger. Pathogenesis[edit] An ulnar claw may follow an ulnar nerve lesion [1] which results in the partial or complete denervation of the ulnar medial two lumbricals of the hand. Since the ulnar nerve also innervates the 3rd and 4th lumbricals, which flex the MCP joints aka the knuckles , their denervation causes these joints to become extended by the now unopposed action of the long finger extensors namely the extensor digitorum and the extensor digiti minimi. The lumbricals and interossei also extend the IP interphalangeal joints of the fingers by insertion into the extensor hood; their paralysis results in weakened extension. The combination of hyperextension at the MCP and flexion at the IP joints gives the hand its claw like appearance. If the ulnar nerve lesion occurs more proximally closer to the elbow , the flexor digitorum profundus muscle may also be denervated. As a result, flexion of the IP joints is weakened, which reduces the claw-like appearance of the hand. This is called the "ulnar paradox" because one would normally expect a more proximal and thus debilitating injury to result in a more deformed appearance. Simply put, as reinnervation occurs along the ulnar nerve after a high lesion, the deformity will get worse FDP reinnervated as the patient recovers - hence the use of the term "paradox". A simple way to remember this is: Ulnar nerve symptoms[edit] The ulnar nerve runs from the shoulder to the hand, and damage to it results in the Ulnar claw. It is linked to palsy, which is a result of peripheral neuropathy. There is a range of ways that damage to the nerve can occur. Leaning on the elbow can lead to long-term wear and tear due to the prolonged pressure of the weight of the upper body. Symptoms resulting from leaning on the nerve can include numbness and tingling fingers. Occupational causes[edit] Common occupations such as cyclist , motorcyclist, and desk jobs prolong movement and elbow leaning. These activities involve pressure to the palms, which leads to cumulative damage to the nerve. Range of motion can be regained by using hand splints to stretch the impaired hand and to prevent overstretching. Using splints will initiate flexion in the metacarpophalangeal joints while also allowing extensions and flexion in the interphalangeal joints, thus increasing range of motion. Beneficial exercise will be any that strengthens the interosseous muscles and lumbricals. By exercising individual fingers and thumb in adduction and abduction motion in pronation position, interosseous muscles will gain strength. Exercises to strengthen lumbricals, strengthen flexion in the metacarpophalangeal joint, and extension in the interphalangeal joints are beneficial. Repetitive motion of pronation and supination are also effective exercises for rehabilitation. Exercising pronation and supination with a handle or screwdriver attachment will help stimulate the nerves. A lateral pinch and recurring grip can also be applied for supination and pronation. Prevention[edit] Preventive therapy is recommended to preserve the function of the fingers. This may include physical exercise, stretching, proper bodily function and myofascial release massage, foam roller. Exercises are focused on the forearm muscles, such as the extensor carpi ulnaris; extensor digitorum to antagonize the flexion of the fingers. Massaging the forearm muscles also alleviates the tightness that occurs with muscles exertion. Stretching allows the muscles more flexibility , decreasing interference with the innervations of the ulnar nerve to the fingers. Hand of benediction The so-called "Hand of Benediction" is caused by median nerve lesions. The hand will show hyper-extension of the metacarpophalangeal joints MCP from the unopposed extensor digitorum as well as weakened extension and flexion of the Interphalangeal IP joints of the 2nd and 3rd digits index and middle due to deficits in the radial lumbricals and lateral half of the flexor digitorum profundus. The pathogenesis is similar to that of ulnar clawing loss of the relevant lumbricals and the flexor digitorum profundus along with unopposed action of forearm extensors , and a median claw hand will appear similar to an ulnar claw when the patient with a median claw is asked to make a fist. The following

signs may be used to clinically distinguish median nerve clawing from ulnar nerve clawing. Ulnar nerve Deficit is primarily in 4th and 5th fingers Deficit is primarily in 2nd and 3rd fingers. Deficit is most prominent at rest and when the patient is asked to extend his fingers. Deficit is most prominent when the patient is asked to make a fist. Often accompanied by inability to abduct or adduct the 2nd, 3rd, 4th, and 5th finger. Often accompanied by difficulty opposing the thumb. Often accompanied by apparent atrophy of the first dorsal interosseous muscle of the hand Often accompanied by wasting of muscles of the thenar eminence Main article: Presenting as a small hard nodule in the base of the ring finger, it tends to affect the ring and little finger as puckering and adherence of the palmar aponeurosis to the skin. Klumpke paralysis A claw hand can result of injuries to the inferior brachial plexus C8 - T1. The condition may arise from the limb being suddenly pulled upward.
