

1: Microblog: final piece of the puzzle | Stock Gumshoe

The Foolish final word Google has been increasingly focusing its efforts on AI and planning for an AI-centric world. While it typically does not release the terms of acquisitions, it is telling.

Janet Yellen and the Fed are hell-bent on raising interest rates, which should increase the value of the dollar. Historically the economy slows down when rates begin to climb yet the stock market is soaring. High inflation affects all of us and generally signals a weakening of the currency. Where is the market headed? Will we see inflation and reduction in the value of the dollar? They are headquartered in Zurich. Rob has a worldwide perspective on investing. When they place a trade for their clients, they search for good investments, and then decide the best currency to use holding the investment. Most US investors never think about this; your broker normally has all your investments in US dollars. He agreed to give us some of his time for an interview. Rob, on behalf of our readers, thank you for your time today. I want to start by asking about the dollar and inflation. To me inflation is the value of one currency in relationship to others. When the US government bailed out the banks and created trillions out of thin air, many felt the value of the dollar would go down. It appears the rest of the world was devaluing their respective currencies at an even faster rate because the dollar increased. From a global perspective, what do you see happening with the dollar in ? Thank you for inviting me. Indeed, a very interesting question. It does seem that national banks worldwide are doing everything possible to devalue their respective currency, be that in Euroland, China, Japan or even Switzerland. As expected, the Federal Reserve has started hiking interest rates and signaled they want to raise rates three times in , however that is always subject to change. What was not expected is this hike put pressure on the US Dollar against all major currencies. The big winner being the Australian Dollar, closely followed by the Swiss Franc which is yet again trading below parity against the US dollar. We are slowly seeing inflation coming back. We are also convinced that the current administration is not in favor of a strong US Dollar. You mentioned Russia, China and the Saudis are selling off some of their dollar denominated debt. Selling when the dollar is high works to their advantage. Looking into the future we very strongly believe that we will be seeing a retracement of the currently overvalued US Dollar and believe this is a window of opportunity to diversify into foreign currencies. Last year we had Brexit. Other countries are also discussing leaving the European Union. No one really thought the British could pull it off, but they did. Do you see other countries leaving the EU? If so, what effect could it have on your US clients? It would not be a surprise to see the populist parties in Holland, France and Germany becoming winners during the upcoming elections. This is good news for Europe and the Euro. The elephant in the room will of course be France. We will have to wait for the outcome of the French election before we really know what the future of Europe will look like. We might even see the Euro strengthening versus the US Dollar in the not too distant future. If the populist parties win, there will be great uncertainty. I want to comment on the election in the Netherlands. They must now negotiate with the other parties to form a coalition for a majority. The Populist Party, despite a second place finish, is not likely to be part of the negotiations. It is much different than what we are used to in the US. So far worldwide inflation with a few exceptions has been kept moderate because the major countries were devaluing, almost in tandem, and maintained some parity among the major currencies. The Japanese seem hell-bent on devaluing ahead of the crowd, which has not helped their economy that much. What do you see in , will any major currency break out of the pattern, either increasing or decreasing in value? This may come as a surprise to your readership but beware; inflation is slowly but steadily on the way up in many western countries. The European Central Banker, Mario Draghi, has been doing everything he can to get inflation back and it seems that he is finally getting there. The same is true for Switzerland, as well as the USA. The ugly D-Word deflation is finally disappearing. Having said that, we will have to watch the beginning stages of this inflationary period very, very carefully. Rob, if you were to pick one currency to own in , what would it be and why? Since we do expect a further retracement to the upside in commodities, we are currently having a very close look at the Australian Dollar, which started to retrace some of the losses we had been seeing accumulating during the past 2 years against the US Dollar. We also strongly feel that because of the insecurities worldwide, be that

political or economic, the Swiss Franc will be used as a safe haven currency. While most Americans generally have their US accounts in dollars, we believe a diversified currency base provides an additional layer of safety. While I know you have clients worldwide, many are in the US. If you had one piece of advice for our readers, who are very concerned about their ability to retire comfortably, what would that be? As already mentioned during this interview we see a window of opportunity arising for American clients. Despite all the volatility we are seeing in precious metals, we still strongly suggest having part of your total wealth invested in precious metals during these very insecure and difficult times worldwide. Thank you so much for your time. My pleasure Dennis Dennis again. His global perspective is refreshing. While President Trump and Janet Yellen are at odds over the best economic approach for our country; Rob points out that elections in Europe and the actions of the Russians, Saudis and Chinese may be the major factor in determining the value of our dollar. That will have a major effect on our exports, economy and our stock market. Their perspective is much different from the reports we find in our inbox regularly. Rob has reinforced my belief that the political climate around the world influences our investments dramatically. NO prior experience needed to master these 10 simple options trading rules. 2: DESPENSO | Capital Management

final piece of the puzzle. By motion, April 6, Travis what is your take on this motley fool article? keep up the great work. This is a discussion topic or guest.

Publicity Image Sporting glories never beckoned. Presumably it became pretty obvious pretty fast that his would be a life of the mind. Born in north London in to a Greek-Cypriot father and Singaporean-Chinese mother, he is the eldest of three siblings. His parents are teachers who once owned a toyshop. His sister is a composer and pianist; his brother studies creative writing. Technology did not loom large in their household. My sister and brother both went the artistic route, too. None of them really went in for maths or science. Hassabis was determined that his company should remain close to his roots, despite pressures to move elsewhere including, presumably, Mountain View in Silicon Valley. Tesla, Ramanujan, Plato, Feynman, Aristotle. Is he a fan? Socialising is an intrinsic way of life: The engineers “mostly male” that I pass in the corridors shatter the stereotype of people working in the nerdier corners of human endeavour: A certain air of intellectual glamour, it has to be said, vibrates in the atmosphere. The only limitation is how many people we can absorb without damaging the culture. Every night, Hassabis hops on the Northern line to get home in time for dinner with his family. They live in Highgate, not far from where he grew up. Their two sons are seven and nine. Hassabis will play games and read books with them, or help them with homework. There are invariably Skype calls to be held with the US until 1am. Or maybe strategic thinking about the company: Or it might just be something I read in an article or saw on the news that day, wondering how our research could connect to that. So what about Hassabis himself? Does he “can he” ever switch off? I do love reading books, watching films, listening to music, but it tends to all come back to what I do. And he tells a lovely story of befriending a fellow undergraduate called Dave Silver at Cambridge and later teaching him to play board games “including a certain ancient Chinese one” in their spare time. Twenty years on, I notice, one David Silver is the main programmer on the Go team at DeepMind, and the lead author of the most recent Nature paper. Otherwise, why do it, given how short life is? If there is no way to have such a guarantee, then they will probably be created nevertheless. Unfortunately, it might also be the last. In his view, public alarmism over AGI obscures the great potential near-term benefits and is fundamentally misplaced, not least because of the timescale. The company, although obviously not subject to the sort of official scrutiny that the government-led Apollo or Manhattan projects were, operates pretty transparently. It tends to publish its code, and a condition of the Google deal was an embargo on using its technology in military or intelligence applications. They recently helped co-ordinate another such conference, in New York, and their much-trumpeted internal ethics board and advisory committee has now convened albeit privately. But in all our systems, the top level goal will still be specified by its designers. For the machines to become super-intelligent, or for them to succeed humankind? Then we need to be sure that we know what their capabilities are going to be. He is friendly and very convincing. Everything he says seems reasonable, not particularly hubristic, and who knows: But many remain sceptical. And he robustly defends his decision to keep proceedings private at this stage. The two recently met in Cambridge for a private conversation instigated by Hassabis. He missed lunch, so his minders were not very happy with me. He glances around the room, with its indecipherable glyph-strewn whiteboards. All our journalism is independent and is in no way influenced by any advertiser or commercial initiative. The private companies were chosen (from a pool of over 1, candidates) by CB Insights' Mosaic algorithm, based on factors like financing history, investor quality, business category, and momentum.

That makes for one amazing opportunity to earn serious returns that should handily beat the market over the next ten years. It might very well take a lifetime for someone to completely master all of the intricacies of their chosen field whether it be economics, astrophysics, or genomics. And even then, there is so much dynamic data involved with emergent properties that humans need help solving complex problems. From an investment viewpoint, artificial intelligence has become a very popular buzzword and has become a sector of growth everyone wants to grab a piece of. As editor of Growth Stock Advisor, it is a sector I am keeping a close eye on. Just to use one example, let me take a closer look for you at Microsoft. This company completely missed the smartphone revolution. Even though it has made efforts there to catch up, the very sparse Universal Windows apps store shows it never has. This platform will rely heavily on artificial intelligence. At the conference, Nadella also emphasized another key point. Take Microsoft as an example. The acquisition was specifically aimed at getting expertise in conversational queries. Today, DeepMind is the acknowledged leader in AI research with a staff of researchers. So, my advice to you is to keep an eye on who buys even more British AI knowhow in the future. As editor of Growth Stock Advisor, I will keep you up-to-date on this subject. Investing Now But what about right now? It invested heavily early in the AI game by building chips that are tailor-made for deep learning. Today, its chips are the de facto standard in AI. The company provides the graphic chips used in the personal assistants of both Amazon and Google.
