Today, 13 months later, this one now looks to me like the worst of my lifetime. I was looking for my first real job during the recession of I started my first business during the recession of the early s. I moved that company from California to Oregon during the recession of I laid off five people in a single day during the recession of So what do we do about it? Specifically, what do we as business owners, managers, and entrepreneurs, do about it? What exactly are the fundamentals? Planning means plan and review, revise, and correct, and review and revise and correct again. Watch how the assumptions change. This is absolutely fundamental to planning. Review your numbers frequently. Watch for changes, surprises, and the unexpected. Watch the short-term closely. Use your planning as an early warning system. Watch the cash flow. A business-to-business company needs extra financing worth a month of sales for every 30 days longer that customers hold off their payments. Obviously sales, costs, and expenses are metrics, but measure wherever you can, and watch for changes. Phone calls in and out? Metrics work for early warning. Your business plan is always wrong, but vital. See point number 1. Your business plan is never done. Now, as 13 months ago. Most urban planners work in existing communities, but some help develop communities -- known as new towns, new cities or planned communities -- from scratch. Either way, urban planners must consider three key aspects of a city as they map out their programs: Because drinking water is so crucial, many cities are founded at the head of a river or at the fall line, the point where rivers descend from the regions of older, harder rocks toward the softer sediments of the coastal plain. The rapids that often form at the fall line mark ideal locations for towns and villages to evolve. Coastal cities also have a great advantage in that their accessibility positions them to become important trading centers. For example, the physical environment of New York City and the surrounding region reflects the culmination of a billion years of geologic activity. Over this great span of time, mountain ranges formed and were worn away. Seaways came and went. Most recently, episodes of continental glaciation covered the area with ice sheets that eventually retreated. All of this activity makes New York City what it is today and affects how it might change in the future. One of the biggest issues in most cities is the inequitable distribution of resources. United Nations Human Settlements Programme]. As a result, the social environment can be a risk factor for disease and mortality as much as individual risk factors. Planners work with local authorities to make sure residents are not excluded from the benefits of urbanization as a result of physical, social or economic barriers. All cities work hard to support the retention and expansion of existing local businesses. As you can imagine, urban planners must do a great deal of research and analysis to fully understand how the physical, social and economic aspects of a city interact. Before they ever put pen to paper, they study: The current use of land for residential, business and community purposes The locations and capacity of streets, highways, airports, water and sewer The types of industries embedded in the community The characteristics of the population Employment and economic trends They also gather input from residents, government officials, politicians, business executives and special groups. Armed with all of this information, planners develop short- and long-term strategic alternatives for solving problems in a coordinated and comprehensive manner. They also show how these programs can be carried out and how much they will cost. All of these details are captured in a formal document known as a comprehensive plan or a master plan.
