After an unprecedented increase during the 20th century, global population growth is decelerating. The number of people living in poverty in developing countries has declined in the past 20 years. People are living longer and enjoying healthier lives. Fewer children under five are dying, and more children are completing primary school. Much has been achieved, but much remains to be done. The maps and charts in the Atlas bring to life the sharp disparities that still exist in the first decade of the 21st century. They show the gaps in income between countries 2 World Bank Atlas and the inequalities between the rich and poor within countries. They show the distribution of natural resources and how countries are using or misusing these endowments. Consider some of the disparities that emerge as you go through the Atlas: The other 20 percent is shared by the 5 billion people living in developing countries. The rest either drop out or never attend school. To help reduce these disparities, member states of the United Nations met in and adopted the Millennium Development Goals. Most of the additional 1 billion people will add to the population and poverty in the poorest countries. The challenge of fighting global poverty is clear, and I know that you will find the Atlas a useful introduction to the many dimensions of that challenge. The demographics of the future speak to a growing imbalance of people, resources, and the environment. If we do not take on these challenges now, we shall leave greater and more intractable problems for our children. But if we act together now, we can change the world for the better.

The World Bank Atlas, 27th Edition. World Bank, Washington, DC. This twenty-seventh World Bank Atlas presents key social and economic information for every country on the globe organized under three headings, People, Economy, and Environment.

Responsible consumption and production Ensure sustainable consumption and production patterns The equivalent of more than kilocalories of food per person a day is lost in the supply chain in Latin America and the Caribbean before it even gets to the final consumer. By reducing such waste, and promoting recycling, reuse, and more efficient practices across high-consumption economies and those highly dependent on natural resources, Goal 12 looks to bolster the mechanisms for sustainable development to flourish. Doing more with less Goal 12 aims at "doing more and better with less," increasing net welfare gains from economic activities by reducing resource use, degradation, and pollution. It involves different stakeholders across the full production cycle, including business, consumers, policymakers, media, and communities. It addresses aspects ranging from resource and chemical use to food loss, solid waste, recycling, consumer behavior, subsidies, technology, tourism, and government procurement. Balancing the use of natural resources to foster growth Goal 12 encourages the efficient use and sustainable management of natural resources target This takes into account investment in human capital, depreciation of fixed capital, depletion of natural resources, and pollution damage. Consistently negative saving rates indicate diminishing wealth and unsustainable development. Positive savings form the basis for future growth. Resource-rich countries that depend heavily on extractive industries ideally balance the depletion of their natural resources by investing in other forms of capital, such as building human capital through education. Forgoing some consumption by increasing savings and reinvestment of resource rents is a tough proposition in poorer countries, where living standards are already low. But improving the sustainable and efficient management of resources in these countries will be critical for long-term growth and development. Minimizing food loss and waste Food loss can occur at any stage of the food supply chain, and refers to decreases in both food quantity and food quality. Goal 12 seeks to minimize waste throughout the chain target Food loss estimates are based on FAO food balance sheets that do not, however, include post-consumer food waste. Only meat, offal, and animal fats fell, with losses amounting to around half that lost before reaching consumers in figure 12b. A suite of quantification methods under the standard gives users a range of technologies and resources to assess food loss on a comparable basis. Adjusted net savings is net national savings plus education spending and minus energy, mineral, and forest depletion, carbon dioxide damage, and particulate emission damage. Recycling and reusing waste Goal 12 calls on nations to substantially reduce waste through prevention, reduction, recycling, and reuse target Waste Atlas database , D-Waste, Athens, [http: Goal 12 encourages such reporting and the integration of good sustainable processes in all industries and sectors target Three-quarters of these companies reference established guidelines for sustainability reporting by the Global Reporting Initiative, but fewer than half have their corporate responsibility information independently verified and assured by a third party. In governments in more than 50 countries had regulations, guidance, standards, or other policies to encourage or require sustainability reporting by companies and other organizations.
