

1: IBM Deployment recommendations for Tivoli Storage Manager Version 6 servers - United States

Tivoli Inventory - PDF: HTML: LANG: Release Notes. Release Notes for Linux on PowerPC: User's Guide. Messages: Configuration Repository Poster.

This operation must be allowed to run to completion. For complete documentation and recommendations about upgrading to a V6 server, review the following documentation: The following alternative methods are designed to reduce the downtime that is associated with upgrade and migration processes: Database backup and restore operations can be used to migrate the database. Migration Engine from Butterfly Software can be used to plan and complete the upgrade or migration process. The Butterfly software is available as part of a service offering. For more information, see Migration Engine from Butterfly Software. Expert users can take advantage of the hybrid upgrade-migration method. The hybrid upgrade-migration method combines database migration with export and import operations. To successfully use data deduplication for V6. This page provides a consolidated view of information related to data deduplication. This provides the ability to replicate the database entries and corresponding data for client nodes that are assigned to the server. Replication can be done for the entire server or other levels of granularity such as by client, by file space, or by data type backup, archive, etc,. For more information, see Replicating client node data. Back to top Performance The following performance information can help you to successfully implement and deploy a Tivoli Storage Manager V6 server. The following links provide additional guidance related to performance improvement: Daily operations for a Tivoli Storage Manager server: Changing either or both of these values has the following implications: When the server is installed, attributes for its database are set that are dependent on the host name. If the host name is changed, the database must be updated to match this corresponding value. For more information, see Changing names in Tivoli Storage Manager. When you change the server name, the following warning is displayed: Changing the server name could adversely affect: For example, changing the server name affects Windows clients that are using generated passwords. See Setting the server name. This issue does not affect users of Tivoli Storage Manager V6.

Tivoli® Inventory User's Guide Version Tivoli Inventory User's Guide iv Version Preparing to Install Tivoli Inventory Products on Target Systems.

The Software Package Editor makes use of a simplified single file format, called the Software Package, for content packaging. Software packages can be generated by different means, including: Therefore, regardless of the technique used, the resulting package will be identical. Through use of variables, which allow you to make the software package more generic, and conditions, which allow you to define the circumstances under which a specific action will take place, you can expand the flexibility of the software package. This can eliminate the need to create a different package for each type of platform within your enterprise. With software and hardware dependencies, you can ensure the package is installed only if the necessary prerequisites are satisfied. With software package version checking, you can prevent the installation of down-level software and can ensure the software package status is consistent. These powerful tools allow you to make good use of your time and resources. In addition, TSD supports some common third party packaging formats, and content prepared in these formats and their associated utilities and response files can be incorporated within the Software Package. The Activity Planner is a TSD feature that can improve administrator efficiency and can enhance scalability by enabling you to define activities, schedule their execution, submit them to be executed, monitor, and control their outcome. Activities can be single operations that are performed on a set of targets at specified times. Operations can include TSD 4. Operations can have dependencies among them which define circumstances under which the operation should be executed. Change Configuration Management Helps Manage Software Changes Change Configuration Management CCM, together with the Activity Planner, can support software distribution management and change management in a large network by managing groups of workstations as single entities. CCM can help you to manage frequent software changes to different groups of workstations by: Keeping track of software already installed Helping you decide which workstations need a certain version of software Providing a scalable and flexible way of specifying the required hardware and software machine configuration. With CCM, you can manage software by grouping software packages and subscribers into a reference model that represents a workstation profile. Using this grouping, CCM can help to ensure that the target workstations are maintained at the specified level. The workstation reference model can enable you to manage workstation software based on the role the workstation plays within the network. Byte-level-difference can improve network utilization by reducing the amount of data that needs to be distributed to install updated versions of software packages. By creating and distributing a package that contains only the delta between two versions of the same package, administrators can reduce the network load, improving the efficiency and scalability of the distribution and installation process. The enhanced TSD Web Interface can improve the efficiency of mobile users by providing a powerful set of high-performance options that enable Web users on UNIX and Windows endpoints to perform a large number of operations such as, download, install, uninstall, subscribe to, and verify software packages with an immediate update of the status. It also provides access to CCM reference models to which you can subscribe and be automatically notified when an update is available. A local facility can enable Web users to manage locally installed software packages. Data Moving Service Helps Maintain Data Consistency In any distributed systems environment, maintaining consistency of data across the system can be a major problem. Data updates have to be distributed from a central point, and information collected locally must be retrieved for central consolidation and storage. This provides support for: Sending, retrieving, and deleting files The execution of pre- and post-transfer tasks Support for Mobile Users Mobile users are becoming a large part of the workstations that must be managed in large distributed systems. These types of users are difficult to manage because frequently they are not connected to the enterprise network when distributions occur. Download and install software packages at their convenience Pause and resume downloads Monitor the

progress of the download and installation of a software package Download packages to the local workstation and then install at a later time Reject optional software packages Be notified about mandatory packages including optional escalation messages created by the submitter of the software package distribution Pristine Tool Enables Installation Incorporating new workstations into the management environment can be a time consuming process especially if these workstations do not have an operating system installed. Using the TSD 4. At the end of the installation process, you will have a workstation that is ready to be managed by Tivoli. Through integration with other Tivoli applications, the capabilities available to an administrator are expanded beyond distribution. A system administrator can: Use Tivoli Inventory and the TMF query facility to query a configuration repository to determine the appropriate targets of a distribution, as well as to track information about software distributions and the change management status of software packages on target systems. In the firewall area, the enhancements include a consolidated port usage that is limited to a maximum of four ports for bulk data transfer. This does not include the control channel 94 and desktop port. For privacy and integrity the SSL3 is introduced. This will protect the management data stream and enable configurable payload encryption. Euro Currency This program is not impacted by euro currency. Product Positioning TMF, which is packaged with Tivoli core enterprise IT system management applications, provides the infrastructure or base services that is, communication, authentication, authorization, and distribution used by those applications. TSD is a key application for efficiently and cost-effectively propagating and maintaining end-user software configurations. It also integrates with other Tivoli applications to provide a complete IT system management suite. Microsoft is a trademark of Microsoft Corporation. 3: Tivoli - Support - Information Center

Tivoli Inventory Version Migration Guide from Version (IBM Redbooks) 1st Edition.

This technote provides information on the various Maximo upgrade programs. IBM Support strongly recommends that you thoroughly review the Maximo 7. This upgrade information is provided for upgrading from Maximo Asset Management 7. Upgrading to Maximo Asset Management 7. If you have an Industry Solution s installed to your system, use the Product Upgrade Requirements link in the version 7 Upgrade Requirements section below to determine your upgrade requirements. Your Maximo 6 system must be at 6. Customers starting at Maximo versions 4 or 5 should ensure they have the latest Maximo 5 to IBM Maximo 6 upgrade program, version 6. If you have not requested this latest version of the Maximo 6 upgrade, you can order this new Maximo 6 upgrade media by completing the Maximo Product Request Form below. Note the Maximo 6 to 7. There is no separate Upgrade media required for this part of the upgrade process. You use the Upgrade Request Form to request upgrade media for Maximo upgrades , , or Those customers that have deployed their existing system to Oracle WebLogic Server and are evaluating an upgrade to 7. For additional information, please click here. Product Upgrade Roadmaps Maximo 6. If you are planning on upgrading to Maximo 7. If your system is currently Maximo 6. To upgrade from 6. Please review all of the considerations and prerequisites that must be in place before upgrading. Additionally, there is no direct upgrade from earlier versions of Maximo v6 to Maximo 7. If you are on Maximo v6, the current upgrade path is 6. If your deployment of Maximo has more than one product , Industry Solution, or add on installed, all must be installed to 7. Although Maximo Support strongly recommends you review the entire 7. Apply Maximo Fix Pack 7. Primavera must be uninstalled before upgrading Instructions in attached upgrade guide. Maximo Everyplace and Maximo Anywhere are mobile products in Maximo 7.
