Translation and commentary on the lectures on Greek rhetoric by Pedro Nunes (): the art of public speaking Author: Pedro Nunes ; John R C Martyn ; Biblioteca P blica de Evora ().

Petrus Nonius;   11 August [1] was a Portuguese mathematician , cosmographer , and professor , from a New Christian of Jewish origin family. He was the first to propose the idea of a loxodrome , and was the inventor of several measuring devices, including the nonius from which Vernier scale was derived , named after his Latin surname. In the 16th century medicine used astrology , so he also learned astronomy and mathematics. When, in , the Portuguese University located in Lisbon returned to Coimbra , he moved to the re-founded University of Coimbra to teach mathematics, a post he held until Mathematics became an independent post in Nunes was, above all, one of the last great commentators, [7] as is shown by his first published work "Tratado da Esfera", enriched with comments and additions that denote a profound knowledge of the difficult cosmography of the period. In his Tratado da sphaera he argued for a common and universal diffusion of knowledge. Navigation Detail of the Monument to the Portuguese Discoveries showing the well-known navigators. He was the first to understand why a ship maintaining a steady course would not travel along a great circle , the shortest path between two points on Earth, but would instead follow a spiral course, called a loxodrome. In other words, loxodromic curves are directly related to the construction of the Nunes connection --also called navigator connection. Yet he was unsure how to solve the problems that this caused: The Mercator Projection is the system which is still used. Geometry Nunes also solved the problem of finding the day with the shortest twilight duration, for any given position, and its duration. The achievement also shows that Nunes was a pioneer in solving maxima and minima problems, which became a common requirement only in the next century using differential calculus. However, this lost importance because Copernicus introduced his heliocentric system theory around the same time. This consisted of a number of concentric circles traced on the astrolabe and dividing each successive one with one fewer divisions than the adjacent outer circle. When an angle was measured, the circle and the division on which the alidade fell was noted. A table was then consulted to provide the exact measure. The method inspired improved systems by Christopher Clavius and Jacob Curtius. Vernier himself used to say that his invention was a perfected nonius and for a long time it was known as the "nonius", even in France. Pedro Nunes also worked on some mechanics problems, from a mathematical point of view. Influence Nunes was very influential internationally e. Over the years had known several designations: Many well known Portuguese personalities have studied in Pedro Nunes. The current headquarters commemorated its centenary in , after being totally refurbished and modernized between and He was featured on escudos coins. The Instituto Pedro Nunes in Coimbra , a business incubator and a center of innovation and technology transfer founded by the University of Coimbra, is named after Pedro Nunes. Bibliography De erratis Orontii Finaei, Pedro Nunes translated, commented and expanded some of the major works in his field, and he also published original research. Commented and expanded translations: Tratado em defensam da carta de marear Treatise Defending the Sea Chart , Petri Nonii Salaciensis Opera, Expanded, corrected and reedited as De arte adque ratione navigandi in Livro de algebra en arithmetica y geometria Book of Algebra in Arithmetics and Geometry ,
