

## 1: eBay Metal Detectors | Treasure Hunting

*Choosing a place to treasure hunt with your metal detector is especially important. It will dictate what you find and how much you will find. If you hunt on the beach, you're likely to find lost jewelry, coins and watches.*

**No LCD screen Technology** There are a few different technologies you should familiarize yourself with when choosing which detector to buy. I will summarize each below very broadly: These are signal frequency machines used for coin, jewelry, and relic hunting. **Pulse Induction PI** Pulse induction PI is a technology used in specialty machines for areas of high mineralization - i. These machines will punch through ground minerals like salt and iron and will report on all metal objects without the ability to discriminate. I use the Minelab CTX for this very reason. **Search Coils** Another thing to consider is the stock coil that comes with your detector. There are a few points you should consider when choosing a coil. **Stock coil size** Generally speaking, the larger the coil, the better the depth. So common sense tells you to buy the largest coil, right? There are other factors to consider. First, ground conditions and mineralization play a huge role in which size coil to use. While large coils get better depth, they also see more of the ground which means your detector has to process more signals in mineralized soil which can lead to very bad falsing, poor target ID and missed targets. A smaller coil would see less of the ground, process less ground signals and allow you to increase your sensitivity to the point where you could be getting the same depth as you would with the larger coil in neutral ground. Make sense so far? **Stock coil type** There are several types of coil configurations - the most widely used being the concentric and the double d DD. Without getting into too much detail, DD coils will get you better detection depth and deal with ground mineralization better than a concentric. Concentric coils are typically more cost-effective. The only real advantage it has over the DD in my opinion is that it can be easier to pinpoint your target. Pinpointing with a DD coil just takes more practice. **Accessory Coil Sizes** Ground mineralization aside, there are a few other reasons why you might want to have additional coil sizes in your bag. These coils are called sniper coils.

*Large Metal Detector, Treasure Hunting Finds Pouch / Bag. For Garrett, Minelab etc. Features Bottom with leak holes, Adjustable Belt Clips. 2 Pinpointer Holders and multiple compartments. by AXProDetect.*

So without further ado You must literally dig every beep to be truly successful here. While retirement type finds have been made in a single hole, it should be noted that it is usually the accumulation of many small to medium sized targets that wins the day here. There are two types of metal detectors that are widely used for gold prospecting. They both vary greatly depending on how you want to hunt - and how much you can afford. VLF very low frequency and PI pulse induction. The VLF detector is what most nugget hunters will start off with. The VLF detector is much more sensitive to smaller gold down to the sub-gram level. On a larger coin sized nugget, they can go several inches deep. Just keep in mind, the small shallow gold is the name of the game with a VLF gold detector. They are very deep on larger nuggets - think feet instead of inches. However, they usually will not be able to find the very small sized gold pieces the sensitive VLF can find. The PI detectors are made to find the big deep stuff we all dream about. Iron is usually the most present and least wanted metal at relic site. A lower kHz detector is just too sensitive on larger deeper iron but great for high conductor coin shooters 7kHz for example. While a higher kHz detector is usually too sensitive and loses depth like a gold detector would want 50kHz for example. While this CAN fall into the relic hunting section, as many relic hunters are most definitely searching for coins, the average coin shooter chooses old parks and schools for a less iron infested hunt. That does not mean there is nothing to discriminate out. Foil and aluminum are the bad guys here. Again - a VLF detector beats a PI here due to its discrimination, fast separation, and recovery speed. It can see the coins next to all the pull tabs and foils bits - just like seeing the coins next to nail and iron bits for the relic hunters. Many coin detectors run in the kHz range which gives a push in depth and is hotter on high conductors compared to higher frequencies. They can run a wide range of frequencies simultaneously and work very well as coin detectors. However, like a PI detector, high trash areas found in many parks and schools are not their best setting. This is where once again a VLF detector with fast separation and speed is a wise option. Many beach hunters choose a PI detector for beach hunting and gold prospecting since it cuts through minerals like a knife through butter. They also treat the beach like gold prospecting and dig it all. A wise move since many gold rings and jewelry are dropped at swimming and tanning beaches. Since gold falls in the foil and aluminum range - digging it all is the only option. FBS and especially BBS detectors do well here since they can ID targets very well - and penetrate the salty mineralized beaches due to running multiple frequencies at the same time. PI like depth and VLF like discrimination make these popular choices. I suppose we could talk about saltwater scuba detecting PI dominated or fresh lake detecting VLF dominated - but I think we will call it day so this blog does not get too long and convoluted.

## 3: 17 Best Metal Detectors in - Metal Detector Reviews & Ratings

*Truth About Metal Detecting and Treasure Hunting - All Info! In-Depth Articles, Exclusive True Stories, How-To Tutorials, Metal Detector Reviews, Secrets and more - a Wealth of Information To Help You Find Treasures!*

A Complete Guide To Metal Detecting Research - this guide will help you master the most important part of the hobby and enable you to determine and locate potential treasure hunting sites in your area. There are many forms of research to choose from, and my guide will introduce you to the basic ones, with more focus given to map research and footwork. Have Fun and Excitement Through My Detailed Treasure Hunting Stories You can learn a lot about cache hunting, coin shooting and relic hunting just from my treasure hunting stories in sections: A full list of my stories is given in this link-directory: I also announce them on my Twitter page. My Best Finds section contains a few short stories on some of my cool treasure hunting finds made in different parts of the world before Some of my uncommon finds that have been made after are shown in my recent articles, tutorials and stories. Metal Detecting Finds And the off-topic photo galleries are listed in Photo Galleries Directory These photo galleries contain many photographs taken during my metal detecting trips in the US and abroad. This section contains pages with images of the best finds made by general detectorists, coin shooters, relic hunters and beach hunters who submitted their photos and short stories to me. Share Your Metal Detecting Experiences I encourage all hobby enthusiasts to submit pictures of their best metal detecting finds that can be shown in this section: Field-test reports for any metal detector are welcomed as well! Great Website Packed with Knowledge! Just wanted to thank you for putting all your insight online for everyone to read and inspire more to get out and enjoy our great hobby! It is very interesting to read! Reading your stories and your tips on metal detecting is very helpful and motivating. I have learned a lot from your site. I have learnt a lot from it, and my learning is still going on, thank you very much! Your enthusiasm and honesty is contagious, and lots of articles show your passion about this hobby. I truly love it when people have passion for what they do, stand for or believe in. I also use the Explorer 2 on a regular basis together with my Vaquero and CZ - they are those detectors which will probably never leave my side. I let all those people with there beautiful and flashy Deus detectors and many other flashy brands be in peace, and hope they find just as much treasures as myself. Or trash as we often do too laughing. You put so much effort into your website and it shows. All those pictures and all those stories, it is just perfect. I want to thank you for all your work and all your shared experiences. All your time spent in the field makes it very believable and very interesting. You did, and still doing a wonderful job. I am saving for a metal detector, and find that your site is the most comprehensive and useful site of all on the web. Thank you most kindly for your website! And all free too! One question out of curiosity, do you still feel the Minelab E-trac is your best overall detector? It is XP Deus now. USA on April 16, Your website makes a huge difference! After I have browsed the web and visited many websites on metal detecting, I gotta tell you, I think your website is a valuable "keeper" in this "webfield" that is full of junk - websites that fill up their pages with multiple keywords but do not give any useful or in-depth information! They claim to be the most resourceful while posting a bunch of empty links and no photos of real finds! To me, it was upsetting to realize that there were no real treasure hunters behind those pages. Visiting your web page was like a breath of fresh air because you are a true treasure hunter and have done a great job sharing your experience and knowledge, inspiring others, and telling the truth! Thank you so much!!! You are the Man! UK on October 4, It has inspired me to really start metal detecting more. I have always been fascinated. The story of your silver coin hoard [the story is temporarily unavailable - S. You deserve that success because of the hard work. Thanks for the useful tips on the website they are excellent to the beginner like me. USA on February 7, I have to thank you for the best website I have seen on this hobby. I wish there were more sites like yours! USA on September 22, I would love to make it down to Poland, visit Auschwitz and a few other places. My wife saw your website and said, "what does he do for a living? He sure is having fun. You have done an outstanding job so keep up the great work. Hope to have it all read soon, love the history part. Glad you enjoyed the pictures hope to send you some of my finds soon. I will be planning and saving for the big trip next year. Keep up the great website and good hunting! However, making and keeping

my website unmatchable on the Internet takes a significant amount of my time it is almost like having a full-time job! Growing a website and making it self-supporting is a "bumpy road". This is why I need your help! Clicking on the donate button will take you to a donation page powered by Donorbox and dedicated to my website MetalDetectingWorld. Donorbox does not store any card or bank data. Credit card information is encrypted and tokenized by the Stripe payment processor. By helping me keep this website alive and growing, you will sure help many detectorists around the world as well! By now it has taken me a long while to create a new code for my webpages in order to make them mobile-friendly. Currently I have only a few major pages remodeled, and it is going to take me a long time to reconstruct a huge load of almost 5, pages. If you are currently visiting my website via a mobile device, please do not get irritated when a clicked link takes you from a responsive page to a static, unresponsive and scrollable page with large images. Please be patient while I am trying to finish a huge task. Thank you for your understanding! If for some reason you dislike my website or even hate it, at least take a look at this nice Russian lady Victoria in NYC!

Posted on May 18, by Emily Fetner To understand gold , you have to address it in layers, since there are so many aspects of it. In our last Brain Food blog, we discuss the different types of gold in gold jewelry. Purity is one of the most important things you should consider, especially if you are going to buy gold. How much the gold item is, is directly related to purity. So, to start, how is purity measured? Gold purity is measured in Karats. Karats are expressed in fractions of As quoted by source 1, 24K is If someone invests in gold and has gold bars, they are 24K as well. Investing in gold requires at least 22K and up. There are also 9K, 10K and 14K gold. There are also low and high karats. If the karat is lower, the stronger it will be. If it is higher, it will be softer. See this handy gold purity conversion chart. Other lists of stamps that can be used to measure gold purity include: This consists of a base metal, like brass, with a certain thickness of gold electrolytically deposited onto the base. When the gold is heated and pressure bonded to the base metal. It must have a minimum purity of 10K gold. All of these will help you understand gold as a valuable element and make the right decisions for buying, selling, collecting, etc. We do encourage you to further research the subject if it really interests you. There are plenty of wonderful sources and you can take your pick for what is right for you.

*Find great deals on eBay for treasure hunting metal detectors. Shop with confidence.*

The Armstrong Site was part of the amazing story of our national origins rooted directly in the battle between the French and Spanish for possession of Florida in the year 1565. I became very excited to learn as much as I could about the story of the Metal Detectorists and the Armstrong Site. After over two years I finally put this podcast together thanks to Terry Armstrong. Terry Armstrong runs the publishing house of Signum Ops, and he has produced an array of titles dealing with treasure, salvage, and shipwrecks. This is the place to do your serious treasure hunting research. I have five of his books so far and will invest in more. Here are two of my favorites so far. Armstrong Terry and Doug are not related. Armstrong is the person the Armstrong Site is named after. This book is a brief recollection of the events leading up to the heinous Matanzas massacre, followed by the investigative report of what may have happened to the few Frenchmen who escaped the Spanish death trap. More than four hundred years later, the author, in cooperation with the N. A. controlled excavation reveals evidence of a Surruque Indian settlement where these castaways lived with the native people. Fully indexed with bibliography, the book contains detailed photos of coins and artifacts recovered during the investigation along with scanned reproductions of the manifests for a number of the French vessels involved in the wreck disaster along the Florida coast in 1565. Prior to the acquisition of properties on Cape Canaveral and Merritt Island by the federal government for the Air Force Eastern Test Range and the Kennedy Space Center, residents in the vicinity were aware of the many shipwrecks along the coast from Edgewater southward to present-day Port Canaveral, an area now known in Florida as the Space Coast. As the Kennedy Space Center was being developed, a number of treasure hunters combed the area, making remarkable finds dating from ancient times throughout the first contact period between Florida natives and Europeans. Before the creation of the Canaveral National Seashore and the Merritt Island National Wildlife Refuge, some of these treasure hunters managed salvage leases all along the Cape Canaveral area, awarded to them by the State of Florida. E5A was situated along the southern extent of Klondike Beach, perhaps so named for the booty found there in the past. Marx, as well as a number of aerial charts especially prepared by the author. Personal notes of Robert F. Marx dealing with shipwrecks around the Cape are included, along with a summary of archaeological sites recorded by George A. Long for NASA in 1964.
