So let me explain how each of these alternatives to iron on transfers are, or were, used. Traditional methods of transferring patterns Prick and pounce This is a wonderful method for transferring your design onto smooth fabrics. It will not work on coarse fabrics or those with a pile, such as velvet. Although laborious, it does produce an accurate outline and is ideal for finely detailed designs. There are a few items that you will need to use this method Take a piece of soft fabric, about 10cm 4 inches wide and long enough to roll up into a cylinder about 3cm 1. Roll it tightly and stitch the end in place. Print the pattern off the Internet, or draw your own on paper, and place it on top of the cork or felt pad. Take the pin-vice or needle and start pricking tiny holes along the outline of the design. Keep the holes close together, especially around curves. Try to fit about 20 holes to each inch of outline. Take your time, you do not want to make any errors at this stage. Take frequent breaks to give your arm, shoulder and neck a rest. When all the holes are pricked hold the pattern up to the light so that you can see the outline clearly. You will soon notice if you have missed anything. Next place the material you wish to embroider on a hard surface with the right side uppermost. Pin the pricking to the cloth firmly, you do not want it to move part way through or you would have to start over. Dip your rolled up pad into the pounce powder and rub it all over the pricked area. This will push the powder through onto the cloth underneath. Very carefully remove the pricking from the material. Pour any leftover powder back into the container to use another time. Check your design on the fabric. Did it all appear in a fine dotted line? In this case, pick up the cloth and shake it to remove the markings then pin it down and try again. If your pattern is complete it is time to make the design more permanent by carefully painting with your fine paintbrush over the lines of the design. Try using watercolour paint first, but if it does not "take" on your particular fabric you may have to resort to oils. Remember to slightly thin the oil paint down if necessary, with pure turpentine to get a fine line. Leave the paint to dry, then flick off any remaining powder, which will leave you with your design transferred onto your fabric ready to start stitching. As I said at the beginning, a painstaking task, but well worth while if you want an accurate pattern. Tacking method - alternative to iron on transfers For those with less time to spare, you might like to try the tacking method as an alternative to iron on transfers. Here we will need some tissue or tracing paper and tacking thread. This method is not as accurate as the pouncing technique but it is fine for simple outlines without too much fine detail. It is also useful for textured fabrics that will not allow any other method to be used. Print the design and trace it onto tissue paper or tracing paper. I have also successfully used the really thin paper known as bank, on which carbon copies used to be made when I first started working. Place the fabric on a hard surface and pin the pattern on top. Then thread your needle with sewing cotton in a colour that will show up I try to avoid black or red as they can leave a trace if not completely dye fast. Do not tie a knot in the thread, but make a couple of back stitches in the same place to secure the beginning and end of each length. Take running stitches all around the design outlines through both the paper and fabric. Take smaller stitches into any tight corners so that they are marked clearly. Also do the same thing along curved lines. On straight lines you can get away with longer stitches. Once all the lines have been tacked, carefully remove the paper, leaving the design showing in running stitches on the fabric. These stitches can be removed as you reach them when embroidering. Dressmakers Carbon Paper This is another alternative to iron on transfers. Dressmakers carbon paper is not the same as the old carbon paper we used to use when typing a letter on a typewriter. Dressmakers carbon paper is normally available in a pack containing sheets of different colours This particular pack also had white sheets which are very useful for darker fabrics. You can only use this technique on smooth fabrics. Place your fabric, right side up, on a smooth surface. After picking a coloured paper that will show on your fabric, lay the carbon paper, shiny side down, on top. Then position your pattern on top of everything else. Pin all the layers in place, then with a pencil or biro ball tipped pen draw carefully over the outline of the pattern. You might want to unpin a corner just to check that you are using enough pressure. Once all the lines are transferred, unpin and lift off the pattern and carbon paper and

you are ready to stitch. Using a window If you are wanting to embroider on a fine, sheer fabric then you can use a window as a makeshift Light Box Draw or print your pattern onto paper and use masking tape to attach it to a nearby window. Then put your fabric over the top of the paper and again tape in place. Using a hard pencil, draw around the outline which will show through the fabric. Modern methods of transferring patterns Iron on transfers are still available if a little difficult to find. Some modern day magazines still include them, and you can order a number of books of iron on transfers from Amazon using the links on this page. However, we have some additional ways of getting a pattern onto cloth nowadays Disappearing ink pens There are two types of disappearing ink pens There are even some pens on the market with two ends, one of each type. If you just want to draw a simple shape on a piece of freestyle embroidery these are great. If you get it wrong you know it will fade away within minutes or that you can use clean water to wash it away. They are also great for drawing parallel lines to act as the top and bottom of a row of stitches so that they all end up the same size. They are not the best idea for transferring a whole design onto a complicated piece of work as they may disappear before the work is finished. Transfer pencil and pens If the designs you want to stitch are not available as commercial iron on transfers then you can make your own with the help of these pens and pencils. The main thing to keep in mind is that you need to draw the design back to front as it will be reversed when you iron it on. This is, of course, especially important when including lettering in your project. Using your lazer printer It has also come to my attention that you can use lazer printers to print a pattern and then iron it on from that. Coloring with wax crayons Lastly I am currently experimenting with using coloured wax crayons to draw a design, and colour parts of it in, straight onto the fabric. A piece of paper is then put on a hard surface with the fabric on top, crayoned side down, and a hot iron is moved over the back. Much of the wax melts into the paper leaving a faint coloration behind on the fabric as a guide for stitching. Again, I would love to hear from you if you have tried this method before. Summary As I think this page has shown, there are many methods of getting your pattern onto the fabric ready to start stitching. Iron on transfers are not your only option!

4: Aunt Martha's Iron On Embroidery Transfers

Forty-seven iron-on transfer patterns capture the dramatic beauty of such exotic flora as the orchid, hibiscus, bird of paradise, gardenia, white ginger, heliconia, plumbago, plumeria (frangipani), passion flower, night blooming cereus, gloriosa lily and other tropical blooms.
