Kranthi Kiran Member Level: To solve this problem India has recently come out with another ambitious programme called the National Rural Health Mission NRHM to take care of the problem in a holistic manner. In present article I pointed out some of the past and current issues in the health care system in India. I mean present health care system in India. Health Care in India-Present Sutiuation Since Independence, improvement in health care services in the country has been one of the most important objectives of public policy. India being a vast country with high population the task was not easy, as the health care base at the time of independence was extremely poor. A lot of money has been spent in the health care sector but the results have not been upto mark. Reach of health care systems is still poor and skewed and various health indicators are much below the globally fixed standards. With ever growing population, health care and family welfare, along with education, have been quite high on the agenda of social development in the country. It was in the decade of s that the mortality rate in the country reached a plateau and the country faced the dual disease burden. While communicable and waterborne diseases continued to be a problem area, the changing lifestyles of the people in urban areas posed a new challenge of non-communicable diseases including the diabetes, cardiac-related problems and hypertension. The existing health care system suffers from various problems and deficiencies. There is inequitable distribution of health care institutions and the technical and para-medical manpower. Despite the fact that about 25,000 doctors in modern medicine are produced every year in the country, along with similar number of other practitioners and paramedics, there still exists huge shortage of trained and skilled manpower in the institutions providing primary health care, particularly in the rural areas. The problem is even more pronounced in remote and tribal areas. What are the Reasons for Poor Health Care in India I think one major reason for poor health care in the country is the emphasis on curative health care at the cost of preventive health care. Traditionally, health care in the country is perceived as part of social responsibility of the State, rather than as a paid service. But with economic and demographic changes that are sweeping the country, the focus is gradually shifting to the paid services. For a change, capital investment in health care and super specialty health care is being seen as a good investment option. But the government has to incentivise the private sector to invest in health care sector in rural areas to supplement the government effort. There are alarming disparities in the country among the States so far as the health care indicators are concerned. As per the Approach Paper, though the Infant Mortality Rate IMR in the country has improved from 80 per live births in the year to around 60 in the year , the IMR in the worst State was 83, while the same in the best State was just 11 in This shows skewed distribution of health care availability and access in the country. Similarly, under-nourished children are about 47 per cent of the population in the country, but the best State of the Indian Union has only 20 per cent children as undernourished while the worst State has about 58 per cent undernourished children. All the above statistics indicate that the high levels of growth have not helped in securing equitable distribution and access to health care facilities in the country over the years. Greatly concerned by the lack and disparity in the availability of health care facilities, the government of India, in , came out with a new initiative to tackle the problem of rural health in a holistic manner. Called the National Rural Health Mission NRHM , this new flagship programme aims at providing accessible, affordable and quality health care to the rural masses, especially the vulnerable sections of Indian society. Related Articles Ten commandments for a good Health Awareness This present world becoming a world with full of diseases. People living in many kind of diseases like bodily disease, mental disease, spritual disease, knowledge disease, social disease, want of money disease etc. The following ten commandments are for a good health awareness. Fitness tips for students It is necessary for students to remain physically fit and mental fitness depends on it. If a student has a healthy body, he will develop a healthy mind which is good for studies. It is not necessary to join Yoga or gym classes to remain healthy. There are a number of activities that one can do to remain fit. In this article I will discuss fitness tips for students. This implies to our daily habits also. Do you

think that you are showing high moral standard by following that fixed healthy and hygienic routine. Latest research has shown that some everyday good habits could be eroding your health. Does eating coconut increase cholesterol? Do we get higher cholesterol levels by eating coconut in our regular diet? It is a frequently asked question by many of us. Research has proved that the animal based food in our day to day diet can affect our cholesterol level. Coconut is the most common cooking ingredient in our Indian food recipes.

Fingerprint Has the ability to identify network operator related data Has the ability to query the phone location (GPS) Has the ability to read the device ID (e.g. IMEI or ESN).

Big data in health care How three organizations are using big data to improve patient care and more By Anne-Lindsay Beall, Insights Editor Health care may have gotten off to a slower start than some industries in taking full advantage of big data. Now many organizations in this data-rich industry are focused on using big data and analytics to make life-altering changes in patient education, treatment and more. We can digitize and quantify almost every aspect of human beings. Analytics helps prevent deadly infections Sepsis is an extreme inflammatory response to infection that can lead to tissue damage, organ damage or death. The condition moves fast, and it kills around a quarter million people in the US each year. It can be very hard to spot, particularly in hectic environments like emergency rooms. The fifth-largest health system in the US and the largest hospital provider in California, Dignity Health uses a big data and advanced analytics platform to predict potential sepsis cases at the earliest stages, when intervention is most helpful. Using the Sepsis Bio-Surveillance Program, Dignity Health monitors , lives per month in 34 hospitals and manages 7, patients with potential sepsis per month. Collecting data from the electronic medical records of all patients in its facilities, the solution uses natural language processing and a rules engine to continually monitor factors that could indicate a sepsis infection. In high-probability cases, the system sends an alarm to the primary nurse or physician. Since implementing the big data and predictive analytics system, Dignity Health has seen a significant improvement in the mortality and ICU length of stay for its sepsis patients. Because patients spent less time in the ICU, the program delivered cost savings as well. Sepsis is the costliest condition billed to Medicare, the second costliest billed to Medicaid and the uninsured, and the fourth costliest billed to private insurance. Better decisions, healthier outcomes with big data Express Scripts handles millions of prescriptions annually through home delivery and retail pharmacies. This could have profoundly positive consequences for health: A health care provider would know before writing a prescription for painkillers whether the patient is at high-risk to become dependent. A different treatment plan or more careful monitoring could be selected. Adherence to medication regimens post-hospitalization can predict the potential for re-admittance within 90 days. Providers could take action to avoid the re-admittance. Monitoring fraud and waste, improving clinical outcomes The largest health insurer in the US, United Healthcare is processing data inside a Hadoop big data framework using big data and advanced analytics to give them a degree view of each of its 85 million members. Other opportunities for big data in health care The promise of big data in health care is staggering. Learn about other possibilities big data and analytics have created for the health care industry. Who is most likely to succeed? Episode analytics helps health care organizations create more encompassing and flexible treatment plans for patients, payers and providers. Using analytics to improve quality of care and patient experience at the lowest possible cost is core to population health analytics. Virtual care and wearable health care technologies. The rising cost of health care has been a dilemma for years. And few could argue that better preventive care is a great way to combat the issue. SAS is playing a key role in the development of industry-wide pharmaceutical data transparency. The goal is a secure, globally accessible data and analysis environment where multiple organizations can share anonymized clinical trial information. This would help scientists learn from research more quickly, and thus speed improvements in care. Read More Can data sharing help cure cancer? Subscribe to our Insights newsletter. IHS is the principal federal health care provider and health advocate for Indian people, and its mission is to raise their health.

Healthcare System In India Learn about the healthcare system in India and how it works India has a vast health care system, but there remain many differences in quality between rural and urban areas as well as between public and private health care. Despite this, India is a popular destination for medical tourists, given the relatively low costs and high quality of its private hospitals. International students in India should expect to rely on private hospitals for advanced medical care. Studying in India offers a number of health challenges that students from developed countries may be unused to, so it is important to know how the health care system in India operates in the event you need it. Health care in India is a vast system and can be much like the rest of the country: The government has made health a priority in its series of five-year plans, each of which determines state spending priorities for the coming five years. The National Health Policy was endorsed by Parliament in The policy aimed at universal health care coverage by , and the program was updated in The health care system in India is primarily administered by the states. In order to address lack of medical coverage in rural areas, the national government launched the National Rural Health Mission in Private and Public The health care system in India is universal. That being said, there is great discrepancy in the quality and coverage of medical treatment in India. Healthcare between states and rural and urban areas can be vastly different. Rural areas often suffer from physician shortages, and disparities between states mean that residents of the poorest states, like Bihar, often have less access to adequate healthcare than residents of relatively more affluent states. State governments provide healthcare services and health education, while the central government offers administrative and technical services. Lack of adequate coverage by the health care system in India means that many Indians turn to private healthcare providers, although this is an option generally inaccessible to the poor. To help pay for healthcare costs, insurance is available, often provided by employers, but most Indians lack health insurance, and out-of-pocket costs make up a large portion of the spending on medical treatment in India. On the other hand private hospitals in India offer world class quality health care at a fraction of the price of hospitals in developed countries. This aspect of health care in India makes it a popular destination for medical tourists. India also is a top destination for medical tourists seeking alternative treatments, such as ayurvedic medicine. India is also a popular destination for students of alternative medicine. International students should expect to rely on private hospitals for advanced medical treatment in India. Local pharmacists can be a valuable resource for most minor health ailments. Knowing the Indian health care system and taking reasonable health and safety precautions should help ensure that your time in India is a healthy and enjoyable one! To learn more about the various insurance plans available for students going to India, please see the following plans: Find plans that best fit your needs Residing Outside the US?

The Indian Health Service (IHS), an agency within the Department of Health and Human Services, is the principal federal health care provider and health advocate for Indian people, and provides a comprehensive health service delivery system for American Indians and Alaska Natives.

This relationship, established in 1849, is based on Article I, Section 8 of the Constitution, and has been given form and substance by numerous treaties, laws, Supreme Court decisions, and Executive Orders. Health services for the needs of American Indian and Alaska Natives in the United States were first provided through the Department of War from the early 1800s until the Office of Indian Affairs came into creation and took over the mission. This law requires the agency to give preference to qualified Indian applicants before considering non-Indian candidates for employment, although exceptions apply. Public Health Service Commissioned Corps. This is a non-armed service branch of the uniformed services of the United States. Professional categories of IHS Commissioned Corps officers include physicians, physician assistants, nurses, dentists, pharmacists, engineers, environmental health officers, and dietitians. In 1906, most IHS job openings were on the Navajo reservation. This authority was expanded in 1908 with the Indian Sanitation and Facilities Act, which also authorized construction and maintenance of sanitation facilities for Native American homes, communities, and lands. All federally recognized Native American and Alaska Natives are entitled to health care. This health care is provided by the Indian Health Service, either through IHS-run hospitals and clinics or tribal contracts to provide healthcare services. This policy makes it difficult for an Indian who leaves their tribal home for education or employment to receive health care services to which they are legally entitled. An IHS fact sheet clarifies that Indians are also eligible to apply for low-income health care coverage provided by state and local governments, such as Medicaid. A contributor to Indianz. Others have concerns that the restrictions of the Indian-preference policy do not allow for the hiring of the most highly qualified health professionals and administration staff, so quality of care and efficiency of administration suffer. Participants are paid according to the GS pay-grade system, which is beneficial for college students. Their GS level is determined according to credit-hours acquired from an accredited college. Engineering Extern participants generally practice field work as needed and office work. The IHS was able to build and renovate medical facilities and focus on the construction of safe drinking water and sanitary disposal facilities. The IHS now contracts with urban Indian health organizations in various US cities in order to expand outreach, referral services, and comprehensive healthcare services. The current acting director is Rear Admiral Michael D. Twelve regional area offices each coordinate infrastructure and programs in a section of the United States. IHS areas[edit] A network of twelve regional offices oversee clinical operations for individual facilities and funds. As of 2013, the federally operated sites included twenty-eight hospitals and eighty-nine outpatient facilities. Director, Leonard Thomas, M. Navajo [20] Bemidji Area: Director, Keith Longie, M. Director, Dorothy Dupree, M. Director, Beverly Miller, C. Cherokee [21] Great Plains Area: The name of this area was changed in 1994 from the "Aberdeen" area. A Cherokee [23] [24] Navajo Area:
