

## 1: Safer Survival Distance From USA City Hordes

*Survival & Emergency Preparedness Enter your mobile number or email address below and we'll send you a link to download the free Kindle App. Then you can start reading Kindle books on your smartphone, tablet, or computer - no Kindle device required.*

Activist Post Dies the Fire: An advanced EMP takes out all electronics and even disables gun powder, sending America into the Iron Age where previous strangers must band together for survival. Excellent storytelling and characters who work to rebuild tribal civilizations and defend themselves. This is the first book in a series of eight that evolve into a post-modern Game of Thrones. An EMP hits America and a small group of unprepared office workers organize their community for survival. The story is an enjoyable ride following the main characters through vital decisions and heroic bravery. They have a healthy skepticism of the government and propaganda following the attack which allows them to adopt a plan to be self-sufficient. Much can be gained from the many realistic survival situations and circumstances that play out in this story. A new comet is heading to Earth and is not anticipated to hit. However, a newsman works with NASA to promote the discovery to gain more funding to explore the comet. While doing so people begin to fear that the comet will actually hit, which it does. Some are prepared and others must band together and organize to survive. But no one was quite ready to handle the barrage of tsunamis, wild storms, and the creeping ice age. The Postman is a classic that was made into a lackluster movie. The post-apocalyptic setting is 16 years after the Doomwar that brought nuclear devastation and various forms of dangerous bandits. The story follows a loner, Gordon, who is a wanderer in search of some shred of hope that humanity can live in peace. By luck and circumstance he casts himself in the role of a leader trying to re-establish the US Mail to give hope to surviving villages. Wonderful read, but somewhat lacking in practical survival advice. An EMP hits a totally unprepared America. The story focuses on a small town in North Carolina struggling to survive and weigh life and death. Good storytelling and a believable account of what would unfold in this scenario. This book contains some good practical survival advice while also being an enjoyable read, but it relies heavily on the government ultimately coming to the rescue. That may be the only unrealistic aspect to this novel. An EMP terrorist attack hits the continental United States stranding the main character miles from his wife and children. The book is a narrow tale of his journey to walk from Texas to Montana to get to his family. Scattered throughout is a general idea of how society would break down after such an event, but little in the way of practical survival information. This is the best book in terms of practical survival information with just enough of a story to keep you reading. The main characters are expert survivalists who have prepared for the EMP that takes down America. This is a must-read for the useful prepping information alone. These captivating books follow a band of survivors of a multi-city nuclear attack perpetrated by rogue elements inside the United States. They must overcome radiation, violent storms, EMP fallout, gangs of cannibals and each other to begin forming a community. Excellent story and solid survival tips. The plague has a mortality rate of As he seeks a safe place away from the contact of anyone infected, he finds the island of Boca Chita to be his perfect secluded outpost. As he forms a safety zone, the reader is treated to just the right combination of fast-paced storytelling and the essential minutiae that all preppers and survivalists must focus on. This new addition to both the island and survival genres is sure to please the casual reader and hardcore survivalist alike. Patriots is an excellent account of what would happen to America during a monetary collapse. The story follows a small band of preppers through their training and extensive prepping. As the economic collapse unfolds and grips the unprepared nation, even this well-prepared group must face tremendous challenges. The story is not as exciting as some of the other novels on this list, but the detailed practical survival information is worth the read. Please add your nominations in the comment section below.

## 2: The Best Survival TV Shows You Need to Watch

*Survival (tv series) wikipedia, survival is one of television's longest running and most successful nature documentary series originally produced by anglia television for itv in the united kingdom, it was created by aubrey buxton (later baron buxton of alsa).*

Download Stroke Survival Statistics: Medical treatment has become much more advanced for stroke survivors immediately following a stroke and through rehabilitation, but strokes are a very serious medical condition that require a lifetime of dedication to overcome. Stroke severity is measured by analyzing neurological impairments in language and behaviors and by conducting a CT scan or MRI. Medical professionals will also use the National Institutes of Health Stroke Scale NIHSS , within 24 hours of a stroke, to measure neurological impairment and predict the chance of survival. Each point a patient scores, his or her odds of survival after three months decreases by 17 percent. The following studies examine the fatality rates of stroke so survivors and their families can better understand their outlook post stroke.

**Danish Study of Stroke Survival Rates** A Danish study included 5, stroke patients who suffered a stroke between and All stroke patients in this study were at least 25 years old. The study found that those who survived a stroke were five times more likely to die between four weeks and one year after the first stroke. They were two times more likely to die after more than a year passed. Fewer than 28 days after a stroke, the risk for death was estimated at 28 percent, but after one year, it was 41 percent; after five years, the risk increased to 60 percent. The study attributed excess mortality rates to other health issues, like cancer, cardiovascular disease and other diseases, suicide, or accidents. After one month, 36 percent of the patients died. The majority of these patients suffered from intracerebral hemorrhage. Of the surviving patients, 60 percent who suffered an ischemic stroke and 38 percent with intracerebral hemorrhage survived one year, compared to 31 percent and 24 percent, respectively, after five years. At the end of the study, 29 percent of the stroke patients were still alive. The study found that those 50 or younger had a higher survival rate than those 70 or older, at 57 percent and 9 percent, respectively. Additionally, the long-term survival rate five years is better in patients who suffered from intracerebral hemorrhage compared to those with ischemic stroke. However, those who suffered from intracerebral hemorrhage were more likely to pass away within the first 30 days of the stroke. This study focused specifically on 18 to 50 year olds , since the long-term effects of first-stroke survivors in this age range is not widely studied. Another purpose of the study was to gain a more comprehensive look at stroke survivors by including those with ischemic stroke, intracerebral hemorrhage, and first-ever transient ischemic attack TIA. The majority of the patients studied suffered from ischemic stroke. The study found that, among day survivors, the risk of death by the twentieth year mark was highest for ischemic stroke patients, at Those with intracerebral hemorrhage had a Melina Gattellari, a senior lecturer at the University of South Wales, states that TIAs can have significant effects on long-term survival rates, much like a stroke. As TIA patients age, survival rates steadily decline , with a 4-percent decline in life expectancy after the first year and a percent decline by the ninth year.

**Studies of Stroke Mortality Rates in England** England reviewed a collection of studies analyzing stroke patients in the U. During this time, U. Although this shows an improvement in medical care for stroke patients, the State of the Nation stroke statistics makes it clear that stroke can still be fatal. By the time they reach their 75th birthday, one in five women and one in six men will suffer a stroke. Out of those who suffered from stroke, three in ten will have a TIA or recurrent stroke. One in eight strokes will kill a survivor within the first 30 days and 25 percent within the first year. This is largely due to the disabilities nearly half of stroke patients will face after a stroke.

**Stroke Survival Rates in Elderly Populations** A Canadian study was conducted on stroke survivors 61 years on average or older to determine the survival rates of the elderly population. Over a third 38 percent of the patients were at least 80 years old, and this group also had the highest mortality rates during their hospital stays, at Those under 59 years old died at a rate of 5. Those over 80 who survived suffered from so many impairments that they were unable to return to their homes and, instead, had longer hospital stays or were cared for in medical facilities.

**Variations in Effectiveness of Treatment Centers** A study on those who have United States Medicare benefits analyzed 91,

patients who survived a stroke between April and December. The patients were treated at hospitals all over the country. The study found that almost two-thirds of Medicare patients would either need to be readmitted within a year or would die after discharge. However, higher-performing hospitals saw a lower mortality rate in stroke patients.

9. Moscow 7-Year Survival Rates Study A district in Moscow analyzed 1, stroke patients who suffered a stroke between January 1, , and December 31, . The purpose of this study was to gain a better understanding of stroke survival rates over a longer period of seven years. This study found that within three weeks of suffering a stroke, . Over the next seven years, the study followed of the remaining stroke survivors to record both recurring strokes and deaths, while also finding links between recurring strokes and survival rates. In the first three months, not counting the first three weeks after stroke, most of the patients who did not survive suffered from pulmonary thromboembolism. After three years, . After five years, . The study found that those who had multiple strokes had a higher mortality rate than those who suffered from other health issues, like cardiovascular disease. Interestingly, nearly half of all patients suffered from transient ischemic attacks.

Understanding Stroke Risk Strokes have always posed a series of intense complication for survivors. While treatment options have gotten better and initial treatments are better than they have ever been, it is important to understand that all stroke patients face significant hurdles in recovery. ### 3: Survival | United States | Urban & Wilderness Emergency Preparedness

*These are the best survival TV shows voted on by fans like you. If you're ever stuck in a desert or jungle, these shows may just help you survive for a little bit longer. It is a hot genre now, with many new survival shows airing each year.*

He was only 5 years old, his mother and step-father was moving his brother and him to Utah from Los Angeles. Somewhere outside Bakersfield in the middle of the desert the radiator on the car overheated and blew the top off, stranding them. So they sat in what shade they could find with no water or food for those long hours in the summer desert. He has written magazine articles and has a newspaper column in the local newspaper, and is available for lectures, seminars and classes. He is also one of the only Emergency Preparedness and Survivalist instructors to teach you where you are not where he is no matter where in the United States it is. We will travel to you to give training classes in either or both Wilderness Survival and Urban Preparedness. We do ask that your group be at least 20 or more to have a class this keeps the cost down for you and expenses down for us. Our staff is made up of professionally trained personnel. Passionate, experienced, talented and friendly, we truly have the best of the best. Get to know the people behind the business, who are dedicated to making sure your needs are not only met, but exceeded. He began his survival training at the age of 5 while stranded in the desert. His exceptional skill set, true passion and creativity has inspired massive growth. You are welcome to use her expertise anytime just contact her for a one on one or groups for this valuable training. Her web site is: So even just getting that manual is well worth the fee. At just under pages listed as pp on the website , this book provides great detail on several subjects. James goes into great detail on how to make the knot, as well as when it would be most useful. Although it was a bit overwhelming initially, I started to fully understand the depth of knowledge and detail that was added for every section. Size up your surroundings, Use all your senses, Remember where you are, Vanquish fear and panic, Improvise, Value living, Act like the natives, Live by your wits. I do not think I have ever heard anyone explain it as well as he has, which proves to be just another benefit of this book. The way the book is laid out with a spiral bound binding, ensuring the pages lay flat while I am trying to refer to the subject matter, proves very beneficial when learning and I feel it was a very smart decision. Not many books follow this pattern and was very pleased that this one did. While I have reviewed many books, I thought this to be presumptuous. After reading the pages I was proven wrong as I was truly amazed. I want to thank Mr.

## 4: CDC - Cancer Survival in the United States

*United States Army Survival Manual [Department of the Army] on [www.enganchecubano.com](http://www.enganchecubano.com) \*FREE\* shipping on qualifying offers. Bomb threats, anthrax scares, and the fear of nuclear warfare.*

ShareCompartir More white people than black people survive 5 years or longer after being diagnosed with many common cancers. Better screening and treatment could help narrow the gap. The 10 cancer-specific papers in the supplement provide the percentage of people who live for at least five years after being told they have cancer. The numbers are grouped by Race black people and white people. State in which the person lived when he or she was diagnosed with cancer. How far the cancer had spread when it was found stage at diagnosis. It helps scientists find out why people with certain kinds of cancer live longer in some countries than others. It is the largest study of population-based cancer survival to date in the United States. Public health agencies can use this information to help target early diagnosis and treatment services. Fewer than half of people who got stomach, liver, lung, or ovarian cancer lived at least five years after diagnosis, although this percentage is going up. There were large differences in survival between black people and white people for nine of the 10 cancers the study looked at. Breast cancer survival was high between and , but there were wide and persistent differences in survival between black women and white women. Federal, state, and local agencies must work together to reduce racial disparities in breast cancer survival. Colon cancer survival showed little improvement between and Five-year survival among black patients has yet to reach that of white patients who were diagnosed 15 to 20 years earlier. Rectal cancer survival also showed little improvement between and There were persistent differences in survival between black people and white people. Some progress was made in survival for patients with liver cancer, but five-year survival is still low, even for those whose cancer is found early and has not spread beyond the liver. Lung cancer survival improved slightly between and , but was lower among black people than white people. Making sure all patients receive timely and proper treatment would help reduce the differences in survival between states and lower survival among black people than white people. The survival rate for black women was lower than the survival rate for white women in both time periods. Large and consistent racial differences were seen in most states, and black women have lower survival than white women. The percentages of both black men and white men whose cancer was found early and had not spread beyond the prostate increased during this time. Stomach cancer survival improved slightly between to and to The differences between black people and white people are small. In children with acute lymphoblastic leukemia, survival for five years after diagnosis is high, but racial differences were found.
