This report is just a main instructional exercise. With improvement of the app approaching conclusion, the next phase is always to test that. Players will undoubtedly be randomly assigned to 1 of two organizations: psychosocial treatment versus knowledge and assistance alone.

2: t-Test for Two Independent Samples

under Work Unit and Work Unit The following two letters used as part of the number designating technical reports of research published under the Repair, Evaluation, Maintenance, and Rehabilitation (REMR) Research Program identify the problem area under which the report.

It is simple, straightforward, easy to use, and adaptable to a broad range of situations. Its utility is occasioned by the fact that scientific research very often examines the phenomena of nature two variables at a time, with an eye toward answering the basic question: Are these two variables related? If we examine two different levels of one variable, will we find them to be associated with different levels of the other? Here are three examples to give you an idea of how these abstractions might find expression in concrete reality. On the left of each row of cells is a specific research question, and on the right is a brief account of a strategy that might be used to answer it. The first two examples illustrate a very frequently employed form of experimental design that involves randomly sorting the members of a subject pool into two separate groups, treating the two groups differently with respect to a certain independent variable, and then measuring both groups on a certain dependent variable with the aim of determining whether the differential treatment produces differential effects. A quasi-experimental variation on this theme, illustrated by the third example, involves randomly selecting two groups of subjects that already differ with respect to one variable, and then measuring both groups on another variable to determine whether the different levels of the first are associated with different levels of the second. Question Strategy Does the presence of a certain kind of mycorrhizal fungus enhance the growth of a certain kind of plant? Begin with a "subject pool" of seeds of the type of plant in question. Plant and grow them under conditions that are identical in every respect except one: After some specified period of time, harvest the plants of both groups and take the relevant measure of their respective degrees of growth. Begin with a subject pool of college students, relatively homogeneous with respect to age, record of academic achievement, and other variables potentially relevant to the performance of such a task. Have the members of each group perform the series of mental tasks under conditions that are identical in every respect except one: Note that the distinction between experimental and control group does not apply in this example. Conclude by measuring how well the subjects perform on the series of tasks under their respective conditions. Run the members of each group through a standard aversive-conditioning procedure, measuring for each one how well and quickly the avoidance behavior is acquired. Any difference between the avoidance-learning abilities of the two strains should manifest itself as a difference between their respective group means. In each of these cases, the two samples are independent of each other in the obvious sense that they are separate samples containing different sets of individual subjects. The version of a t-test examined in this chapter will assess the significance of the difference between the means of two such samples, providing: To illustrate the procedures for this version of a t-test, imagine we were actually to conduct the experiment described in the second of the above examples. We then have the members of each group, one at a time, perform a series of 40 mental tasks while one or the other of the music types is playing in the background. The following table shows how many of the 40 components of the series each subject was able to complete. Also shown are the means and sums of squared deviates for the two groups.
