Start studying Unit 2 Test (Assignment 4). Learn vocabulary, terms, and more with flashcards, games, and other study tools.

Representative Group of the entire population being studied. An attempt to explain the relatedness between two sets of observations. As one set increases, the second one also increases. This type of research is also known to create a scientific biography of an individual being studied. This type of test utilizes predictive validity to help determine that which the subject may be good at. In testing a subject, these types of questions are known as free response types. Frenchman who originally developed the IQ test in order to help identify children needing additional assistance in Parisian schools. Highly-recognized psychologist who is considered the "Father of Psychoanalysis. Alfred Adler focused his research on how people feel that they are never quite good enough. In this process, a person learns more easily by seeing the task performed than by simply being given directions on how to perform it. A study over a long period of time with the population being studied over and over again. This testing is specific to a long-term study. It is the very first measure of the subjects in order to establish a base of information for comparison. In this type of study, neither the subject being studied, nor the scientist administering the tests knows whether the subject has the independent variable or is a member of the control group The ability to measure that which the experiment was intended. Did your study really apply to your theory? The ultimate goal of humanistic psychology is for each human to realize their full potential. Western American University that developed many of the aspects of commonly used IQ tests. According to Abraham Maslow, there are several characteristics of self-actualized people. One of these is the ability to control yourself and make decisions for yourself. This is called what? Type of bar graph that is always vertical and that bars touch one-another. As one set increases, the second one decreases. In a scientific experiment, this variable is the one changed by the scientist. It is the part of the procedure that is manipulated by the experimenter. This type of test question limits the subject to one possible response from a limited list of options. This type of test is interested in surveying your preferences on a topic. This measure of reliability takes a test and divides it in two. Theoretically, it assumes that the subject should perform equally well on both parts. One of these is reacting immediately to brand new stimuli. As Carl Jung stated, there are several inherited and universal ideas that are common in differing cultures around the world. Name the defense mechanism that has the person go back to a less mature state of existence. This portion of an experiment is the final result that occurs because some part of the process was manipulated. It is what the researchers believed will be different as a result of the change. In a large-scale experiment, this group does not receive the manipulated variable at all. The purpose of this group is to establish how people would react without that variable. Age as determined by comparing how you answer questions in relation to how others of various ages answer them.

This is the vocabulary for Unit 2- Quiz 2 for Spanish 2. Learn with flashcards, games, and more "€" for free.

Carbohydrates also perform numerous roles in living things. Describe the general composition of a protein molecule. Proteins are composed of amino acid molecules linked together by peptide bonds. C, H, O, N, S are typically used. Describe how the structures of proteins differ from the structures of carbohydrates. Amino acids contain amino and carboxyl groups and peptide bonds are between these ends. Primary chains of amino acids, Secondary folds, sheets, helices, tertiary folding and bending and quaternary multiple polypeptides structures are necessary for the correct function of the protein. Carbohydrates are composed of C, H, O in a 1: The monomers are monosaccharides. They are composed of chains of these simple sugars. Two monosaccharides make a disaccharide. Many monosaccharides make a polysaccharide. Describe how the functions of proteins differ from the functions of carbohydrates. Proteins function as enzymes, antibodies, non-steroid hormones and structural components. Carbohydrates function as short-term energy storage starch and glycogen or structural components chitin, cellulose, glycogen. The material was then analyzed by other scientists. Analysis showed that the chemical was composed of long chains of repeated copies of CH₂ molecules. Which type of organic molecule was most likely formed by the scientist in the laboratory? Which statement best describes the role of an enzyme during this reaction? How can a change in pH affect an enzyme? A change in pH can cause the enzyme to change its shape. This results directly in the inability of the cell to release energy from nutrients. What type of inhibitor is this poison?
