

1: Photo Law – Your Right to Take Pictures in Public – Legal Andrew

The exhibition We are standing Inside of a Picture by Merete Vyff Slyngborg draws attention to the dynamics between art, design, trends object and representation, in the transition between 2D and 3D, investigating the field of the image producing industry.

Haunted Cemeteries Kathie May 20, , 8: When there are many, does it mean many spirits or just the one? I have taken many videos with only light from camera and they seem to be having a party with me watching! Link admin May 30, , 3: Lucky you for capturing them! One orb is considered to be one spirit, so if you have many orbs, there are many spirits. I love your comment about them having a party with you. Link Megan December 3, , Selina was able to contact my grandfather who recently passed. It was a beautiful experience, I now know he is at peace and is just fine. So since this, I have read many of the blog articles on here and this one in particular caught my interest. I have gone through old pictures and found that orbs are evident in a few. I asked for them to sit on the couch so I could take a picture just like mentioned in this article above and it worked! I am so happy to be embracing this. Thank you Selina for having such a great website!! I am so happy that what came through helped. I would love to see that picture of your spirit guide. All the best, Link koren bellman February 14, , Link Bla February 19, , I used to think it was my camera but then I got a new one and ya same thing. And they are not dust particles in one photograph one blocked out my entire face. Link Tony Fitzpatrick February 28, , 9: After dinner and late evening I took some photos of the amazing room we had been given, the flash photos on my mobile showed numerous Orbs, one photo had 5. Never in the same spot from photo to photo. My lens were clean. My partner loved the experience, she even tried to talk to them. I spent the rest of the night under the bed sheets, terrified. Your site certainly explains to me what its all about. Maybe as written above, they just wanted to party with us! Link Beth Crysel March 16, , 1: I would love to share this picture with you and see what you would say. Please contact me if you are interested. My mom has so many questions to see if My grandmother was these orbs. Link admin March 19, , I am sorry to hear about your brother. Yes, it was very likely a guardian angel or other type of being that would be a protector or guide. The pink horse image is interesting! It could also be a message to you. Selina Link Samantha April 13, , 1: Link admin April 13, , Thank you for sharing the photo with us! First of all, there are many spirit orbs here and some are related, some are not. There is a very strong female presence on the right side just behind where everyone is standing. I agree with you – it does feel like a grandmother energy. Looks like you had a full family portrait! It has tons of orbs! Link admin April 14, , 2: Thank you for sharing these photos with us. There is also a close up of the orb. Can you see a female face in this orb? Link admin April 14, , 3: Some people tend to attract this activity. This happens because they are either very supported by spirit, or they have a gift themselves and spirits are trying to contact them. Link Sarah Bowers April 18, , 3: On Sept 29, he went to his daughters wedding,he has been sick for 10 yrs,in and out of comas,on life support,he has always came through,1 month before the wedding,he was on life support and in a coma,1 week before the wedding,he got better,today,I was looking at the photo of my brother and mother from the wedding,and for the 1st time I looked real good and I see what looks like a spirit walking,and I see mist and I see a face in the tree,Im gonna send you the picture,please enlarge it so you see the face in the tree,please tell me what you think! Thank you Link admin April 20, , 3: I already replied to her privately. What do you think? Is this a spirit? I would like to compare it to a photo of mine. Link nadia May 31, , 6: If you end up posting a photo in a link, could you share that one in particular? Link admin June 13, , Does anyone else out there have photos to share? Link Kirstie July 15, , 1: What could this be? Could I send the photos they are very odd. Link John Jardine July 19, , In several of the pictures not all of them there were as many as a dozen plus orbs of varying sizes and colors ranging from almost transparent to bright blue and even pink. Some of these orbs were in the background while others were within a few inches of my Grandaughter. Our ranch is located a good 10 miles from any known cemetery. Although I have heard about orbs, this is my first time seeing them. I do not think this was a dust partical anomoly as the orbs only appeared in about 4 of the dozen or so pictures that were taken. We all found this very interesting. I love that there are different colours in the orbs. Contrary to popular belief, spirits

do not tend to hang out in cemeteries. Why hang out in a cemetery when you can go visit all the people you love and there is so much to do in other realms? Selina Link nancy July 27, , It sends shivers down my spine, please if you know what this means let me know. Probably a family member in spirit or someone who is watching over her. Have you tried enlarging the photo to see if you recognize the face? Many people believe that spirit orbs are a form that spirits take to travel as it is easier for them. Many people see faces in some of the orbs, although geometrical shapes are more common. Selina Link admin July 31, , 7: Could be his aura you are picking up. When people have a hazy or film in their auras, it could indicate sickness. Some psychics see this when a person is not so love and light, has an illness, or does drugs. Link Kas August 9, , She died in her sleep last week at I noticed tonight there is an orb quite a bit lower than the sun, hovering over my house. Was this a sign or something? If you need to see it, I will send it to you. Katherine August 11, , Troy August 31, , 3: Some are inside the house and others are outside. My wife and I stayed at an historic hotel in downtown San Antonio called the Menger Hotel which was built next to the Alamo. Its reported to have anywhere from 30 to 40 entities depending on differnt reports. It all started then July 24, when for fun we downloaded a iphone application that automatically snaps a picture when it detects anomalies in the area. I lost my brother in February and I am still dealing with his death.

2: Erection - Simple English Wikipedia, the free encyclopedia

"It is difficult to see the picture when you are inside of the frame." -- Author Unknown The original author is unknown. It means that you need to step back and look at things from an outside, objective view, in order to see them clearly. It means you're too close to, or too involved in a situation somehow, that you.

Never went to this kind of detail to develop a story centered on ending on a punchline. Is it worth reading it all? McKinley continued musing, as he crumpled up his check and began writing a new one. The past few weeks had certainly worn him down, yet his passion for ground-breaking research had kept his ambitions unrelenting. His mind no sooner had submerged itself deep into the realm of quantum physics, when he had heard a loud knock on his door. He found himself greeted by a colleague, along with a young, twenty-something. I would, at some point like to discuss my schedule with you. My wife and I have been an emotional wreck ever since. She keeps insisting about moving to the other side of the US to live with her. I feel bad for even bringing up such a personal demand when we are on the brim of making such a discovery. You have my condolences. Oh, by the way, this is my intern, Simon Ingram. Simon turned back to look at Dr. McKinley, as if to inquire where he should go next. As he walked 5 kilometers home, McKinley remained deep in thought. What about the intern? Feeling burned out from work, he welcomed the thought of supervising an intern. Have a seat; make yourself comfortable. McKinley welcomed the intern into his office. Two of them, however, are on the verge of making ground-breaking discoveries. You probably have a decent background on our project by now. Fast forward 60 years, and physicist Peter Higgs had proposed an elementary particle called the Higgs Boson. Quarks, leptons, and forces are all interwoven within it. Perhaps the frequency at which it vibrates, spins! Hell, for all I know: But what we do know is that being able to change manifestations would revolutionize technology. It would change the world as we know it. Several of these sparticles have been discovered, yet not enough to understand dark matter. You no doubt have heard about this, as it has been all over the scientific news. A satellite has been deployed which contains a high-powered gamma laser, reaching record low wavelengths of 20 attometers. It is hoped that we will find something, sending out substantially high density beams of record-low wavelength photons to detectors on the moon. It will be akin to taking a high resolution image from here to the moon. While this is a good approximation over short distances, when we are dealing with long distances, laser beams do, indeed follow the inverse-square law. Much like the LHC, though, we really have no idea what we may uncover. Granted, particles encountered closer to the satellite will leave substantially larger shadows than those encountered near the moon. However, with rapid measurements and careful interpretation, it is hoped that we can figure out the identities and characteristics of the particles encountered. The entire process takes less than half a second. The detectors run at The satellite orbits the Earth on the same plane as the moon, same direction, passing it approximately once every 90 minutes. So, there will be close to readings per year. The equipment currently in use is far more advanced and accurate; this procedure will not only be performed on the Earth-to-moon distance, but also between the Earth and our satellite, in order to have a full, accurate spatial awareness of the experiment. After gathering data for five years, our first run is officially over. The future plans are to run this experiment again in a few years, when the laser has been upgraded to emit over double the photon density, at a wavelength of 8 attometers. Jodi McLain, the head of instrumental operations, had just yesterday emailed me the raw data files. We have been taking readings from seven separate detectors since Each detector is really a panel of over million individual detectors, arranged on a 18, by 12, grid, very much analogous to pixels on your television screen. It is hoped that we will observe intensity gradients throughout each panel, gradients that could tell us something about the nature of what we have discovered. Fermions, bosons, sparticles, or even dark matter components such as WIMPs; anything could happen, or nothing at all. Within the next month, I plan on turning this data over to a team of statisticians, later to be interpreted by theoretical and experimental physicists for meaningful results. Rather than let it sit for a month, perhaps I will turn them over to you for some preliminary calculations. For these two, I would like for you to open them in Excel, giving me a term Fourier series for the intensity as a function of time. For now, this is all I

am asking. I understand that finding intensity gradients and analyzing them goes well beyond the score of what I could ask of an intern. When you apply changes to one individual detector, you should be able to do so to all of the rest if copied over properly. I would separate each individual group of continuous data prior to applying the Fourier series. There are over 1 octillion cells; the file is 2. Come back if you have any questions. Simon opened the large file, saving the original file to his intern folder, and then saving it again to have a duplicate file to work on. After looking up the formula for a Fourier series, Simon had applied it to both of the distance files by the lunch time. He figured he would complete the project before checking his work to see how reasonable the results were. After lunch, Simon returned to take on the much more elaborate file: He opened up the tab for the first detector, which displayed an 18, x 12, grid of cells, each displaying a random, meaningless number. To the left of the grid was a long, seemingly endless, column of values with the top cell highlighted. These values represented, down to the picosecond, the date and time of values displayed on the grid. He had already seen this column before, when he had worked on the previous file. Immediately, every cell on the grid assumed a new value. Simon double clicked one of the values on the large grid, opening up a new worksheet which displayed two columns that he had seen before: Columns a quintillion entries in length seemed hard to deal with so, he collapsed it down to show on in every 10 billion cells. Simon eventually figured out a means of detecting this region of low intensities and separating it. He then used this separation to determine the upper and lower limits of the Fourier series for every wavelength in the data set. After scratching his head for a few hours, Simon finally figured out a way to automatically apply this process to each individual member of the grid. As the end of the afternoon had approached, Simon had already completed the task at hand — aside from checking his work, that is. He first opened the Earth-to-moon distance data. He plotted the Fourier series along with the original data. Visually, the two appeared to overlap and was found to have a high R2 value, at which point Simon uttered a sigh of relief. Simon also recalled that the moon, at its furthest distance from the Earth, was close to , km, although it oscillates throughout each year, and its orbit recedes from the Earth on the order of a few centimeters per year. Further research presented Simon with the respective numbers: Now that he had these numbers, he realized that he could find the apogee and normalize the intensities to imbue a data set of actual distances. Attributing this to instrumental noise or, more likely, his own calculation mistakes, he checked his work against another detector: Checking the other five detectors yielded the same results: His astonishment continued to develop as he found that, in the year , the moon had advanced an additional 61 kilometers; 78 the next year, 95, and finally, just last year the moon advanced another kilometers toward the Earth. Curious as to what this trend might look like, he plotted it against time. He laughed to himself: Yet, here I have the data to actually back up such an outrageous claim. Not only did the data fit to a parabolic curve, but upon polynomial regression, it was found to have an outstanding fit: Simon was now at a loss as to what this could really mean, other than the most ludicrous reason. Yet, more and more, it seemed to fit. The orderly, parabolic trend seemed to make instrumental noise, with its stochastic nature, a much less compelling culprit. McKinley greeted the young intern as he pulled his office keys out of his pocket at 7: For the reason, the annual peak distances between the Earth and the moon, according to my calculations, appear to be decreasing. McKinley knew quite well that the intern had known better, but decided to have a bit of fun with him by putting words in his mouth. Ingram, might I inquire as to where you earned you degree? McKinley continued with his sardonic muse and cheesy comments: The good news is that world hunger will eventually be cured from a sudden surplus of bleu cheese. The bad news is that all of my favorite shops in Wisconsin will likely go out of business by then. McKinley had a change of heart, as he noticed himself standing in front of a young, demoralized intern. Perhaps you can provide some insight for this error. Yet, I plotted the incremental peak distances among the five years, and observed a polynomial trend, one that fits uncannily well to a parabolic regression. In all likelihood, it is just instrumental noise; but to the uneducated layman, it would appear that the moon is accelerating towards the Earth with each progressive orbit, and on the order of kilometers. Yet, given the stochastic nature of instrumental noise, I suspect it is an error of a different nature; I am at a loss as to what.

My son was at a wrestling tournament in Idaho, we live in Montana, and while at this tournament, somebody took pictures of him, and has posted them on a website, this is not the news, they want me, his mother, to see the pictures and buy them.

You have a camera. But do you know your rights when it comes to public photography? Unfortunately, life is never that simple. There are a couple exceptions to the rule and other details you need to know. Does the photo subject expect privacy? Is it a question of national security? It was news to me, but military bases and nuclear facilities can restrict photographs – even from the outside area. You might be shipped off and never seen again. But if someone does confront you about your photography, you can probably win by standing your ground. Krages II has some great questions for you to ask, if confronted. Remember to be polite! Who is their employer? Are you free to leave? If not, how do they intend to stop you if you decide to leave? What legal basis do they assert for the detention? Likewise, if they demand your film, what legal basis do they assert for the confiscation? Private parties cannot take your personal property without a court order. And unless a police officer is arresting you, he cannot take your property either. Get more legal tips Sign-up below to receive my bi-monthly email newsletter with free legal tips. 4: Real Alien Pictures |Alien-UFO-Research|

The eye of a hurricane is an amazing site from above. Inside the eye, winds are mostly light. However, lurking a short distance away lies the surrounding eyewall, where the most intense and.

The coffered dome has a central oculus as the main source of natural light. Lise Hetland argues that the present construction began in , under Trajan , four years after it was destroyed by fire for the second time Oros. This description was widely accepted until the late 20th century. From him we know that "the capitals, too, of the pillars, which were placed by M. Agrippa in the Pantheon, are made of Syracusan bronze", [23] that "the Pantheon of Agrippa has been decorated by Diogenes of Athens, and the Caryatides, by him, which form the columns of that temple, are looked upon as masterpieces of excellence: Domitian rebuilt the Pantheon, which was burnt again in AD. The Historia Augusta says that Hadrian dedicated the Pantheon among other buildings in the name of the original builder Hadr. Dio appears to be the only near-contemporaneous writer to mention the Pantheon. Even by the year , there was uncertainty about the origin of the building and its purpose: Agrippa finished the construction of the building called the Pantheon. It has this name, perhaps because it received among the images which decorated it the statues of many gods, including Mars and Venus; but my own opinion of the name is that, because of its vaulted roof, it resembles the heavens. Emp[eror] Caes[ar] L[ucius] Septimius Severus Pius Pertinax , victorious in Arabia , victor of Adiabene , the great victor in Parthia , Pontif[ex] Max[imus] , 10 times tribune, 11 times emperor, three times consul, P[ater] P[atriciae] , proconsul, and Emp[eror] Caes[ar] M[arcus] Aurelius Antoninus Pius Felix Aug[ustus] , five times tribune, consul, proconsul, have carefully restored the Pantheon ruined by age. Mary and the Martyrs on 13 May Remaining at Rome twelve days he pulled down everything that in ancient times had been made of metal for the ornament of the city, to such an extent that he even stripped off the roof of the church [of the blessed Mary], which at one time was called the Pantheon, and had been founded in honour of all the gods and was now by the consent of the former rulers the place of all the martyrs; and he took away from there the bronze tiles and sent them with all the other ornaments to Constantinople. Much fine external marble has been removed over the centuries - for example, capitals from some of the pilasters are in the British Museum. The marble interior has largely survived, although with extensive restoration. Kirchliche Baukunst des Abendlandes. The interior of the Pantheon in the 18th century, painted by Giovanni Paolo Panini. Among those buried there are the painters Raphael and Annibale Carracci , the composer Arcangelo Corelli , and the architect Baldassare Peruzzi. In the 15th century, the Pantheon was adorned with paintings: Filippo Brunelleschi , among other architects, looked to the Pantheon as inspiration for their works. It is also said that the bronze was used by Bernini in creating his famous baldachin above the high altar of St. In , the broad frieze below the dome with its false windows was "restored," but bore little resemblance to the original. In the early decades of the 20th century, a piece of the original, as could be reconstructed from Renaissance drawings and paintings, was recreated in one of the panels. The Pantheon is in use as a Catholic church. Masses are celebrated there on Sundays and holy days of obligation. Weddings are also held there from time to time. Maria ad Martyres, i.

We have a Sanyo TV projector that would project a darker image while watching a movie. It would get so dark that you could hardly see the actors. We were told to replace the bulb.

Overview[change change source] Part of a Greek vase which shows the second man from the left having an erection. Erect penises have appeared in erotic sexually exciting art for a very long time. Pictures of men with erections appear on ancient objects and in paintings. In the past, the erect penis was also a symbol or sign of health and fertility the ability to give life. Ancient Egyptians , Greeks and Romans believed in gods that had erect penises. Men with larger penises are often thought to be more handsome, manly and powerful. A lot of people also believe that men with bigger penises are better at making their partners feel good when they are having sex. However, this is not always true. This happens in a similar way to an erection of the penis. The clitoris also has a corpora cavernosa, and when a woman is sexually excited this part of the clitoris fill with blood. Men and women may also have an erection of their nipples when they are sexually excited, or if they feel cold. Nipples do not have any tissue in them that fills with blood. Blood flows out of the corpus spongiosum and corpora cavernosa penis, and the penis goes back to its normal size. A man who often has problems having or keeping an erection of his penis is said to have erectile dysfunction ED. On the other hand, an erection that lasts too long is also a dangerous condition called priapism. Men who want to get less erections sometimes take anaphrodisiacs. Penis Penis from flaccid to erect The term erection is most often used to refer to an erection of the penis. When the penis is like this, it is said to be flaccid pronounced FLA-sid. For many men it stands upright. It is okay if it points out or down. When the penis is hard, it is said that the penis is erect or that the man has an erection. The penis usually needs to be at least mildly erect before the man can have an orgasm and ejaculate semen. The scientific name for an erection is tumescence which means "swelling". Some slang terms for having an erection are getting hard, getting wood and having a hard-on, and an erect penis is informally called a boner, hard-on, stiffy, wood or woody. The penis is shaped like a banana or sausage. It has a duct or tube called the urethra running right through it. Semen and urine pass along the urethra to get out of the body. Around the whole urethra is tissue called the corpus spongiosum penis which is Latin for "body of the penis that is like a sponge ". It is near the lower surface of the penis. Also inside the penis near its upper surface are two cylindrical tissues called the corpora cavernosa penis Latin for "bodies of the penis that are like caves ". One of these tissues by itself is called a corpus cavernosum. The corpus spongiosum penis and corpora cavernosa penis are filled with many blood vessels called arteries which carry blood. The nerves then cause a chemical called nitric oxide to be released into the arteries. This makes the arteries dilate become wider , and they fill up with blood. Thus, the corpus spongiosum penis and corpora cavernosa penis all fill with blood and become larger and harder. This makes the penis grow longer, thicker and harder. The corpora cavernosa penis press against blood vessels called veins that let blood flow out of the penis. Since less blood can flow out of the penis through the veins, more of it stays in the penis, which remains hard. During an erection, a valve stops urine from entering the urethra so that only semen flows along it. This is why it is very difficult for a man to urinate when he is having an erection. A man can also become sexually aroused without being touched, for example, if he sees a naked person or thinks about having sex with someone. In this case, his brain sends messages through his spinal cord which is inside his vertebral column or backbone to his penis and makes an erection happen. After a man has had an orgasm and has ejaculated, his erection usually ends. How long this takes depends on the length and thickness of his penis. Nerves in his body cause the arteries in the penis to constrict become narrower. This forces blood out of the corpus spongiosum penis and corpora cavernosa penis. As they go back to their normal size, they do not press so much on the veins leading out of the penis. This lets blood flow faster out of the corpus spongiosum penis and corpora cavernosa penis. Shape and size[change change source] The angle that an erect penis makes varies from one man to another. However, it is common and normal for an erect penis to point nearly vertically upwards, nearly vertically downwards, or even horizontally forward. It is common for an erect penis to have a slight curve in it. The curve can be up or down, or to the left or right. A curved penis does not usually cause a

man any problems when he is having sex. An erection that pokes through clothing is sometimes called a manbulge. The typical girth or circumference the length around the outside of the penis was about The size of an erect penis generally does not change after puberty , the time when a boy becomes sexually mature. Some people have surgery to make their penises larger. Morning wood An erection of the penis can also happen by itself when a man is asleep, often when he is dreaming. The scientific term for this is nocturnal penile tumescence which means "swelling of the penis at night". This is often caused by his bladder being full of urine, which presses on the tissues in the penis. Such an erection is sometimes informally called a morning glory or morning wood. Unexpected erections[change change source] Most boy teenagers have unexpected erections. Sometimes adult men have unexpected erections. Unexpected erections are involuntary and are normal. People call this a spontaneous sudden or surprise erection. Sometimes it happens in school. Sometimes it happens walking. Sometimes it happens taking clothes off for a shower or bath or swimming. Such erections can be embarrassing if they happen in public. Difficulty having an erection[change change source] Erectile dysfunction.

6: September 11 Photos: The Heart-Wrenching Images Of 9/11 That We'll Never Forget | HuffPost

My husband and I were going through some pictures that we took last fall in the park on our bikes came upon one picture with my son myself and my www.enganchecubano.com husband took a couple of pictures of us standing with our bikes, in the first two pictures you see a white light moving towards my daughter the last picture my daughters face looked like.

Tweet One of the all-time best pictures of aliens on earth, the set of four photos show the extraterrestrials roaming the countryside in Mexico unaware of the brave person behind the camera. We have no further information on these pictures as far as the date they were taken or the person taking the pictures. While there are dozens of witness testimonials about a UFO crash landing that looked like a flying saucer near Roswell in Corona, NM the Air Force and US Government used the time tested excuse of "it was just a weather balloon". Though in a report from Lt. Not surprisingly that was soon covered up and disappeared off news stands just days later. Then, in they added in the report that there were crash test dummies aboard and was probably the reason people witnessed aliens being carried off. Which all seems a little too deceiving to us and the rest of the world to really be just another weather balloon. Link to the full story with video for Area 51 Small Alien Captured-Mexico Not much is known about this photograph, but it seems like it was taken in the late 40s or early 50s. As you can see from the picture two men are leading the alien creature away from the public, but not trying to really hide the extraterrestrial in any way when they could easily cover the alien with one of their trench coats. Dead ET Pictures-Outside China The creature in the pic is seen lying on some kind of a table, probably an operating table to do an autopsy, and is badly bruised or burned. The picture of the alien being came from China and is said to have been taken by one of the people working at the time the alien was brought in for study. Presumably the alien was in a crash and did not survive to let the world know why it was here. Unfortunately there is very little known as to what happened to the craft that brought the alien to earth as it was quickly covered up by the local authorities. The Director of National Intelligence acts as the principal advisor to the president, the National Security Council, and the Homeland Security Council for intelligence matters related to the national security. The man in the pictures faced has been purposely blurred out leading us to assume that he was the one who leaked the picture. The mission was to find out if there had previously been water on Mars suggesting life may have been feasible in the past. Spirit sent back this remarkable image of an alien shaped being that of course the US Government is saying was just shadows and rocks. Slightly Mangled Alien on Bed This is a pretty good picture of an alien lying on what appears to be a hospital bed. The body is in a pretty strange position like it was just thrown onto the bed recklessly, but the main thing we noticed were the feet and toes of the creature and how similar they appear to be to our own yet still different. Zooming in it looks like they may be something like toes. If you look at the background it appears that this was done in someones house because there is a wooden entertainment center with a TV on it. However, in light of our relentless movement to find the truth it made it on here anyway just in case. Picture of an Alien Head and Neck In this photo you will see the top half of an alien lying on a table with a very clear shot of its head and neck. The creature looks very old and either beaten up or decomposing. Also, it seems that from this angle the extraterrestrial may have some sort of nose cavity which would mean it would have to take in and or expel kinds of gases like us mammals. Before the USA could get to them, they released documents and photos of the alien they recovered from a crash landing. Fortunately, this picture stayed in the public view and was not confiscated by US intelligence. This picture was taken years back from a long distance away. It is hard to tell if the image is a fake because of how distorted it looks and because we have no hard evidence or testimony about it. Caged This picture of an alien in captivity is of pretty good quality. In this picture you can clearly see that the alien has what we assume is ear holes and nostrils which makes this a very informative picture. Real Dead Alien With its large head and big dark eyes, this image seems to be very credible. Once again you can see the similarity to Homo sapiens with the small nostrils and rib cage. Most likely this is one of the aliens from a number of the crashes around the world. It has been Carbon Dated and has been found to be over years old. It is a skull like nothing we have ever found before - say researchers. The eye sockets are larger and less

deep then are own, the alien skull has no nostril holes, the bone is much thicker than ours yet weighs half of what a human skull would weigh. Unfortunately they are having a hard time extracting the DNA to get a sample to find out if it is actually human, alien, or a human-alien hybrid. Handcuffed Getting into Feds Car This image has been dubbed fake from many sources around the globe, but since it could be a real picture we threw it up for everyone to see. She had no idea the alien was there until after she had the images developed.
