

### 1: Florida Car Title Needs: Transfer Title, Replace, Change Name or Address on Vehicle Title

*The title-safe and action-safe margins in the drawing area of the Titrer designate the safe zones. These margins are enabled by default. Safe zones are useful when you edit for broadcast and videotape.*

It blows my mind how post titles are also used as title tags by WordPress, considering that post titles should be catchy, pithy, and short-and-sweet; whereas title tags should incorporate synonyms and alternate phrases to capture additional search visibility. Now, thankfully, there is a solution, allowing you to decouple post titles from title tags. SEO Title Tag makes it dead-easy to optimize the title tags, meta descriptions, and slugs across your WordPress-powered blog or website. Not just your posts, not just your home page, but any and every title tag, meta description, or slug on your site! Andrew Shell took over development responsibilities from versions 2. For our latest, and most exciting launch, we have recruited the help of Zapbuild. SEO Title Tag 3. Mass editing of title tags, meta descriptions, and slugs for all posts, static pages, category pages, tag pages, tag conjunction pages, archive by month pages, â€” indeed, any URL â€” all in one go. The ability to upload titles, meta descriptions, and slugs directly through a CSV file, making mass editing even easier! Title tags of category pages can optionally be set to the category description. If you use a Meta Tag plugin like Add Meta Tags, then you should not use this feature and instead let the Meta Tag plugin use the category description for the meta description on category pages. If you choose to keep the blog name in your title tags not recommended! Note there is also an option to replace your blog name with a shorter blog nickname. And best of all, the plugin is FREE! Then Download the plugin! To-do Add some more text to the titles of tag pages globally. Got a bug to report? Or an enhancement to recommend? Or perhaps even some code to submit for inclusion in the next release? Share your feedback with the author, Stephan Spencer, either below or on his blog at this post <http://>

### 2: How to Edit MP3 Song Titles | Our Pastimes

*Original Title: Can't change file properties Some downloaded files have a value in the "title" area under details (after clicking properties) I am unable to remove this "title" and it shows up when I share the file across my network.*

They pick up a book, look at the cover, and then are moved to either put it down, turn it over, or open it up just because of how the cover looks. Websites are also judged by their covers and the first impression often comes from the header. The header of your site is typically the first thing people see. From this masthead or header art across the top of your page, people make sweeping judgements about what they are about to see and read. The same people who say you can not judge a book by its cover, also say that you only have 30 seconds to make a good impression. In the world of the Internet where the next web page is a click away, you have much less than that. We are going to take you inside the architecture of a WordPress header and offer tips on how to customize it to become your own book cover, enticing people into your site with a good first impression. Then we will offer some tips from some experts on what makes a good website header. You do not have to get into the code to change the header that comes with whatever WordPress Theme you choose. You can learn more about these parameters in the documentation for `bloginfo`. The header of the Kubrick Theme Again, the template tag featuring the name of the blog or website is in a link, but this shows another usage similar to the URL request above. It gets the same information, just in a different way. Basically, these two header examples do the same thing in different ways. They provide information in the header, with the potential for an image, and make the header title clickable to help navigation on the site. It is just a matter of how much information you want in your header, and how that information is displayed. Using the first example from the Classic Theme, an image can still be used in the background, set within the style sheet in the `h1` selector, but the second one gives more control to the use of an image in the header by giving it its own division. How these look are totally controlled by the style sheet. Styling the Header As listed in the two above examples, the styles for the header are contained within the `h1`, `header`, `headerimg`, and `description` CSS selectors. These are all found within the style. You will have to check both places. The padding on the left side indents the text in from the left. All of these can be easily changed, giving the border a thicker width and making it all the same color, changing the background color, the font size and style, the letter spacing, and more by modifying the information in each style attribute. The same is true of the Default WordPress Theme header, except there are more styles to think about and they are found within the header. Just like the Classic Theme, find these references and make your modifications there to change the look. Changing the header image of the Default WordPress Theme has been simplified with the introduction of a utility called `Kubrickr`. It simply asks you to supply a new image file name for the header and then switches it for you, so you do not have to dig into the code. If all you want to change is the header image, this is an extremely useful and easy tool. If you do want to get your hands into the code, dig into your header styles and make the changes. Below is a simple tutorial on changing just the header image manually. Changing the Header Image There are many different header images and header art available for you to use to change the image in the header. The styles for the header image for the Default or Kubrick WordPress Theme, and any Theme based upon that Theme, are more complicated to change than those for the Classic Theme. The styles are found within the styles in the header. To change only the header image reference, open the header. The use of the `bloginfo` tag only works when the style is used within the head of the template file. WordPress template tags will not work in the style sheet style. To move this style to the style sheet, change the template tag to the actual address URL of the header image graphic. To change the image file, replace the `"kubrickheader`. If you are using an image that is the same size, then simply replace the image. If it is a different size, fill in the height and width of the image in the next section called `headerimg`. If you do not know, and are using Windows, view the folder in which the image resides on your computer in Thumbnail view mode. In Thumbnail view mode, find your image and hold the mouse over it. A small balloon tip will pop up listing the dimensions. Use that information in the styles. Otherwise, just right click on the image file and choose Properties and it should give you the file size and dimensions. Save the template file and upload it and the image to your website and take a look. Some changes may need to be made

to fine-tune the placement and look. With the header image in place, it is time to tackle the rest of the header. All or some of these may need to have the attributes changed to change the look of your header. If you change the size of the header image or header art, be sure and change the other structural CSS selectors like content and sidebar to accommodate the change in the header size. If you are replacing the header within any WordPress Theme, check the size of the header image and then find a replacement that matches that size. If you choose a header image that is smaller or wider or taller than the replacement, you may have to modify the other structural elements of the web page to allow for the change in size of the header. The two most common screen sizes are x and x pixels. Yet, wide screen monitors are gaining ground and web designers now need to prepare for screen widths of x and x. If you set your website to "float," positioned in the middle of the browser window with space on either side, then you can set your header width to whatever you want. If you are designing a Theme with a flexible or "elastic" screen width, then the width of your header becomes important. If you are using a header image that can be repeated, and you are using elastic widths, you can set the styles within the header to repeat to fill the space: You can adjust these to whatever background position your header design and layout needs. Header Art A new term growing in the web design field is header art. These are header images that are usually handmade using combinations of color, shapes, symbols, images, and text. They can take some time and labor to create. While there are some free header art sites, some sites sell their handmade header art. Although a photograph may be unique in its own way and convey the needed visual style, handmade header artwork is easier to match to other web page colors and is usually more aesthetically pleasing because of its distinctive nature. Choosing pre-made header art has some benefits. The artists have already done the work and all you have to do is choose the design that best matches your website. And the graphic is ready to use, already sized and saved as a small file size. Header Art Copyrights The best header art to use, if you do not want to generate your own, is any that bear the Creative Commons License that specifically allows its public use. Usually you must attribute the author, share alike and not use it for commercial purposes. If in doubt, always ask permission from the author before use. Check the website copyrights and licenses and ask if you are in doubt and wish to modify the artwork. Any graphic design software program will work. The graphic design software should have the ability to resize and control the resolution and type of the image when saved. You can use your own photographs, artwork, fonts, and any combination of images to create your header art. When done, save it "for the web" as a jpg, gif, or. In general, avoid file sizes larger than 50K as larger sizes tend to slow a site access times. Hiding the Header Text Many Themes and Theme designers want to feature their header with a picture only, no text. Some will put the text in the graphic image, therefore not requiring the actual use of the text. One option is to remove the template tags that generate the title and description. The other option is to leave it in, but hide it. To hide the header text while leaving it in the code, do not change anything in your template files. Only change the CSS. For example, to hide the text within the h1 selector: It is still there, but the browser has been commanded to not show it in any way. The container literally is "not there. If you are serious about making your site be accessible, some newer text readers access the style sheet and do not read the elements marked display: There are two popular methods for working around this. One is to use the display: The other method is to position the content literally "off the page" by a negative indent. Here is an example: The screen reader will still "read" the text because it is there, but it will not display on the page. Extensive testing has proven so far that this technique works across most browsers and with all screen readers. For more information on either technique and aural style sheets:

### 3: MS Projects - How do I change the title of my Project - Microsoft Community

*Ever wonder what the best way was to edit your title tag in WordPress? In this video post, I walk through exactly how to do it - complete with my favorite plugin recommendation. Title tags are one of the most important pieces of the on-site SEO puzzle.*

We use a number of different sources for this information, including descriptive information in the title and meta tags for each page. You can help improve the quality of the title and snippet displayed for your pages by following the general guidelines below. Here are a few tips for managing your titles: Page titles should be descriptive and concise. Also avoid unnecessarily long or verbose titles, which are likely to get truncated when they show up in the search results. Avoid repeated or boilerplate titles. Titling every page on a commerce site "Cheap products for sale", for example, makes it impossible for users to distinguish one page differs another. One solution is to dynamically update the title to better reflect the actual content of the page: Brand your titles, but concisely. In this case, consider including just your site name at the beginning or end of each page title, separated from the rest of the title with a delimiter such as a hyphen, colon, or pipe, like this: Sign up for a new account. To truly block a URL from being indexed, you can use the "noindex" directive. However, sometimes even pages with well-formulated, concise, descriptive titles will end up with different titles in our search results to better indicate their relevance to the query. Using this alternative text as a title helps the user, and it also can help your site. Users are scanning for their query terms or other signs of relevance in the results, and a title that is tailored for the query can increase the chances that they will click through. If not, consider whether the alternate title is a better fit for the query. If you still think the original title would be better, let us know in our Webmaster Help Forum. How snippets are created Snippets are automatically created from page content. Site owners have two main ways to suggest content for the snippets that we create: Add structured data to your site to help Google understand the page: Preventing snippet creation You can, alternatively, prevent snippets from being created and shown for your site in Search results. Make sure that every page on your site has a meta description. Differentiate the descriptions for different pages. Wherever possible, create descriptions that accurately describe the specific page. Use site-level descriptions on the main home page or other aggregation pages, and use page-level descriptions everywhere else. At the very least, create a description for the critical URLs like your home page and popular pages. Include clearly tagged facts in the description. For example, news or blog postings can list the author, date of publication, or byline information. This can give potential visitors very relevant information that might not be displayed in the snippet otherwise. Similarly, product pages might have the key bits of information—price, age, manufacturer—scattered throughout a page. A good meta description can bring all this data together. For example, the following meta description provides detailed information about a book. Author, Illustrated by V. For some sites, like news media sources, generating an accurate and unique description for each page is easy: For larger database-driven sites, like product aggregators, hand-written descriptions can be impossible. In the latter case, however, programmatic generation of the descriptions can be appropriate and are encouraged. Good descriptions are human-readable and diverse. Page-specific data is a good candidate for programmatic generation. Finally, make sure your descriptions are truly descriptive. Was this article helpful? How can we improve it?

### 4: How to Change the Title of a YouTube Video You Uploaded | [www.enganchecubano.com](http://www.enganchecubano.com)

*Edit a MP3 Song Title with Advanced Tag Editor Click the computer's digital media player application link on your desktop screen. (If no desktop icon is available, access the system menu and go to "All Programs" or "Programs" within the menu options.*

Tamil Telugu You cannot change an Indic title. You can find out what kind of title it is by right-clicking and choosing Properties. To create a title in Indic text: Enable the Indic radio button. Choose the Mangal font and type a text string in Hindi into the Titler. You can do so in two ways: Enable Hindi keyboard and download the necessary font. Copy a text string in Hindi and paste it into the Titler. The Indic text engine makes the Indic alphabets, such as Hindi alphabets, appear properly in the Titler, without any text overflows. Import a title file You can import a title file as you would any other source file. Select a title and click Open. In addition to importing Premiere Pro titles and Premiere Elements titles with the. The imported titles become part of the current project file. Export a title as an independentfile You can export titles as independent files that use the. In the Project panel, select the title you want to save as an independent file. Specify a name and location for the title and click Save. Click drag this thumbnail onto one or more graphic objects in the timeline to update all the text layers in that graphics at once. About safe margins in the Titler The title-safe and action-safe margins in the drawing area of the Titler designate the safe zones. These margins are enabled by default. Safe zones are useful when you edit for broadcast and videotape. Most TVs overscan the picture. Overscanning places the outer edges of the picture outside the viewing area. The amount of overscanning is not consistent across TVs. To ensure that everything fits within the area that most TVs display, keep text within the title-safe margins. Keep all other important elements within the action-safe margins. If you are creating content for the web or for CD, the title-safe and action-safe margins do not apply to your project. The entire image is displayed in these media. Choose, create, and import title templates The title templates included with Premiere Pro provide numerous themes and preset layouts that make it quick and easy to design a title. Some templates include graphics pertinent to certain subjects, such as new-baby or vacation themes. Others include placeholder text that you can replace to create credits for your movie. Some templates have transparent backgrounds, represented by dark gray and light gray squares. You can see your video beneath the title. Other templates are opaque. You can easily change any element in the template by selecting the element and either deleting it or overwriting it. You can also add elements to the template. After you modify the template, you can save it as a title file for use in current and future projects. Alternately, you can save any title you create as a template. You can also import title files from another Premiere Pro project as templates. If you share templates between computers, make sure that each system includes all the fonts, textures, logos, and images used in the template. If you do not have title templates, see this document. After following instructions, your title templates will be restored. When you apply a new template, its content replaces any content currently in the Titler. Click the triangle next to a category name to expand it. Select the template, and then click OK. You can import only Premiere Pro title files. Give the template a name and then click OK. Set or restore a default template With a title open, click the Templates button and select a template. To set the selected template as the default template, choose Set Template As Default Still from the Templates panel menu. The default template loads each time you open the Titler. To restore the default set of templates, choose Restore Default Templates from the Templates panel menu. Rename or delete a template With a title open, click the Templates button and select a template. To rename the selected template, choose Rename Template from the Templates panel menu. Type a name in the Name box, and click OK. If you delete a template using this procedure, it is removed from the hard disk. Create a template from an opentitle With a title open, click the Templates button. Click the Templates menu button. Enter a name for the title template, and then click OK. Show video behind the title You can view a frame of footage in the drawing area as you create the title. Viewing the frame helps you place elements in your title. The video frame is for your reference only; it is not saved as part of the title. Use the timecode controls in the Titler to specify the frame you want to display. The Titler displays the frame under the current-time indicator in the active sequence. Setting the frame in the Titler also moves the current-time

indicator in the Program Monitor and Timeline panel. Moving the current-time indicator in the Program Monitor or Timeline panel changes the frame displayed in the Titler. If you want to superimpose a title over another clip, add the title to the track directly above the clip. In the Titler panel, select Show Video. To change the frame interactively, drag the time value next to Show Video until the frame is visible in the drawing area. The Show Video value uses the same time display format specified in the project settings.

### 5: How to Transfer Your Car Title in Colorado

*Edit Article How to Change the Title of a Wikipedia Article. Are you frustrated by a really badly titled Wikipedia article? If there is a badly worded title that you know needs changing, follow the steps in this article and you'll be on your way to making the article a better-named article.*

Edit the contents of a title or data label on the chart On a chart, do one of the following: To edit the contents of a title, click the chart or axis title that you want to change. To edit the contents of a data label, click two times on the data label that you want to change. The first click selects the data labels for the whole data series, and the second click selects the individual data label. Click again to place the title or data label in editing mode, drag to select the text that you want to change, type the new text or value. To insert a line break, click to place the cursor where you want to break the line, and then press ENTER. When you are finished editing, click outside of the text box where you have made your text changes. To format the text in the title or data label box, do the following: Click in the title box, and then select the text that you want to format. Right-click inside the text box and then click the formatting options that you want. You can also use the formatting buttons on the Ribbon Home tab, Font group. To format the whole title, you can right-click it, click Format Chart Title, and then select the formatting options that you want. The size of the title or data label box adjusts to the size of the text. You cannot resize the title or data label box, and the text may become truncated if it does not fit in the maximum size. To accommodate more text, you may want to use a text box instead. For more information, see Add a text box to a chart. Top of Page Edit the contents of a title or data label that is linked to data on the worksheet In the worksheet, click the cell that contains the title or data label text that you want to change. The changes you made automatically appear on the chart. Top of Page Reestablish the link between a title or data label and a worksheet cell Links between titles or data labels and corresponding worksheet cells are broken when you edit their contents in the chart. To automatically update titles or data labels with changes that you make on the worksheet, you must reestablish the link between the titles or data labels and the corresponding worksheet cells. For data labels, you can reestablish a link one data series at a time, or for all data series at the same time. In PivotChart reports, the following procedures reestablish links between data labels and source data not worksheet cells. Reestablish the link for a chart or axis title On a chart, click the chart or axis title that you want to link to a corresponding worksheet cell. Select the worksheet cell that contains the data or text that you want to display in your chart. You can also type the reference to the worksheet cell in the formula bar. Top of Page Reestablish the link for a data label When you customize the contents of a data label on the chart, it is no longer linked to data on the worksheet. You can reestablish the link by resetting the label text for all labels in a data series, or you can type a reference to the cell that contains the data that you want to link to for each data point at a time. Top of Page Reset label text On a chart, click one time or two times on the data label that you want to link to a corresponding worksheet cell. Reestablish a link to data on the worksheet On a chart, click the label that you want to link to a corresponding worksheet cell. Top of Page Change the position of data labels You can change the position of a single data label by dragging it. You can also place data labels in a standard position relative to their data markers. Depending on the chart type, you can choose from a variety of positioning options. On a chart, do one of the following: To reposition all data labels for an entire data series, click a data label once to select the data series. To reposition a specific data label, click that data label twice to select it. On the Layout tab, in the Labels group, click Data Labels, and then click the option that you want.
