

1: Whisky Classified - 10th Anniversary Edition : The Whisky Exchange

Whisky Classified aims to help the newcomer navigate through the maze of single malt whiskies now available in the off-licence, liquor store and supermarket. If you like a particular malt whisky, then it tells you what other brands taste similar.

It has been presented at several scientific meetings and has been published. Following consultation of industry interests, the results were reviewed and were published as "Whisky Classified" in April. It is now available as a book "Whisky Classified: Choosing Single Malts by Flavour". Tasting notes in 10 recently published books on malt whisky were analyzed for 86 readily available single malt whiskies: Arthur, Broom, Jackson, Lerner, MacLean, Milroy, Murray, Nown, Shaw and Tucek and Lamond. Tasting notes published by the distilleries were also reviewed, where available. Most distilleries produce several brands that are differentiated by length of time in cask, special conditioning or finishing, etc. As our objective was to develop a classification of malts that are readily available to consumers, we felt we should select a benchmark malt whisky from each distillery. We firstly excluded rare malts and any premium brands that are specially aged, cask conditioned or finished. We also decided not to cover distilleries that had been demolished or are not currently in production. Not all of our 10 authors reviewed the same distillation from each distillery, as some limit their tasting notes to house style only etc. Where more than one distillation is produced we selected the most widely available brand, usually of years maturation in cask. New distilleries that currently offer young malts Arran and Drumguish were included for future reference, as they evolve. Vatted malts blends of pure malts, and malt whiskies produced in Ireland, Japan, New Zealand and Wales were excluded. We thus arrived at 86 single malt whiskies of around years maturation, most of which are widely available in the U.K. A vocabulary of aromatic and taste descriptors was thus compiled from the tasting notes in the 8 books. These were grouped into 12 broad aromatic features: The 86 single malts were classified using ClustanGraphics. The cluster analysis groups malts into the same cluster when they have broadly the same taste characteristics across all 12 sensory variables. Technically, the method minimizes the variance within clusters and maximizes the variance between clusters. The result was ten clusters of single malt whiskies, as in the following table. This classification may be freely reproduced provided that the source is acknowledged as follows: Interpretation The order of the 10 clusters A-J maximizes the row-wise rank correlation of the underlying proximity matrix details. Readers who are familiar with malt whiskies may recognise the two extremes of strongly sherried malts cluster A and the heavily peated, mainly Islay malts cluster J. Adjacent to these polar benchmarks are the lightly sherried clusters B and C and lightly peated clusters H and I malts, with the light-bodied, floral and malty clusters, including four largely unpeated groups clusters D-G falling in the middle. A ClustanGraphics tree that summarises the final classification of the 10 whisky types is shown below, in which the last 5 clusters are shaded differentially. The cluster of pungent, peaty Islay malts J is most distinctive, being maintained as a separate group to the end of the analysis, with the "sherries" of clusters A-C the next most distinctive, followed by clusters H-I. The tasting profiles corresponding to each of the 10 clusters are available from clustan for those interested in taking this analysis further, or in using it as a case study. The classification has been analysed by distillery location for Whisky Magazine - details here. Applications The classification may now be of use to retailers and consumers. For example, if you like a particular malt then those in the same cluster should be of interest to your palate. It could be of use by distillers, to type new distillations or to design new malts for marketing purposes. There may also be scope for blenders to select malts from particular clusters to compile a sensory blend they are aiming to formulate. The cluster analysis also finds an exemplar for each cluster, or that single malt which is typical of its class. It can be useful in marketing, for stratified statistical sampling or for selecting a representative sampling panel. For example, when organizing a whisky tasting it is helpful to choose at least one malt from each cluster to illustrate the full range. Indeed, this is done for the whisky tastings that accompany the presentation of Whisky Classified. The development of a standardized tasting vocabulary framework may also be of value to the industry. This study is possibly of limited value because the data were collected from open-ended descriptions by authors who were clearly not

all singing from the same hymn book. But in compiling a vocabulary of nearly aromatic and taste descriptors, grouping them into 12 broad categories, and analyzing the resulting classification in these terms, we have developed a standard, consensual vocabulary which may now be used to type whisky products more objectively. However, this framework clearly needs further development. ClustanGraphics can be used to identify new whisky products by reference to the classification. ClustanGraphics4 then finds the best cluster to describe the product, and the malt which is closest to it in terms of the data entered. Goodness-of-fit statistics indicate how close the product is to each malt or cluster. However, a close fit may not be desirable if the objective is to discover a market segment which is unoccupied or under exploited. In this way, the methodology may be of assistance in the design of new products. It is also of interest to compare the authors in terms of how they rated the 86 malts. We can classify them into types of tasters, and possibly work towards a scheme for recruiting a balanced panel of tasters. Parallel work could be undertaken to develop a consumer segmentation, or a typology of whisky drinkers. It was evident from whisky tastings that there are at least two distinct types of tastes at two extremes - the "Islays" and the "Sherries". Understanding whisky consumers, and what they look for in their favourite brands, is a marketing pre-requisite for developing whisky products with enhanced consumer appeal. Validation Our provisional classification was sent to the 86 distillers covered in the study, and to about others including the authors of the 10 books reviewed, malt whisky societies, independent bottlers, blenders, retailers and academic researchers. A number of whiskies were identified as being in the wrong clusters, six being noted by two or more respondents. The data were re-examined in the light of these comments, and the final classification was further adjusted to take account of most of these apparent misclassifications. Several respondents felt that certain malts should not be clustered together because their peat content, distillery character or cask-maturation method differed. One respondent felt that better results might be obtained using a trained tasting panel. However, this was not the point of our study. The malts were classified by how they are perceived by consumers, as represented by our "panel" of 10 expert authors, and not by the production or maturation methods used by the distillers. Conferences and Seminars Whisky Classified has been presented at several scientific conferences and seminars, which included in each case a tutored tasting sponsored by several distilleries.

Rigorously researched with the cooperation of the whisky industry, this classification of single malt whiskies by flavor has been totally revised and updated to include all the newest single malts from the UK and Ireland.

Not all Islay malts taste like a classic, smoky Islay! Some Speysiders are light and delicate, whereas others are rich and fruity. There are only three distilleries now operating in the Lowland region, and they are nearly miles apart - this hardly describes an appellation or terroir. The Highland region ranges from Glengoyne to Highland Park, miles apart - both by distance and flavour! Some whisky writers try to assess the "quality" of single malt whiskies - they award marks-out-of-ten and construct league tables of "top" whiskies. They are often looking for depth, balance, layered complexity and length of finish - criteria that are very personal to them. But your tastes may be different - you may actually prefer lightly peated, fruity and fresh malt whiskies, in which case their ratings may not be very helpful. Have a look at their ratings in Whisky Magazine , especially the blind tastings, and judge for yourself. Classification by Flavour Whisky Classified aims to help the newcomer navigate through the maze of single malt whiskies now available in the off-licence, liquor store and supermarket. If you like a particular malt whisky, then it tells you what other brands taste similar. On the other hand, if you want to diversify your collection, it helps you choose a range of malts that taste different. Whisky Classified was developed in Scotland by a Scot. Unlike most other authors, David Wishart has actually visited all the distilleries. His preliminary classification was circulated in , a final draft version was issued in February , and Whisky Classified was first published in April - see press release. A subsequent revision was circulated in December and was approved for publication under the imprimatur of Scotch Whisky Heritage which is co-owned by the whisky producers. Forthcoming talks and tastings are listed here Classification of Single Malt Whiskies If you like a particular malt whisky but want to find out more, Whisky Classified tells you all about malt whisky styles for the common brands that are in the shops now, aged years in cask. There is information about our standard flavour profile, and seminars you can attend that include tutored malt whisky tastings. Both were attended by about delegates. Further details of our seminars can be found here. Choosing Single Malts by Flavour by David Wishart was first published by Pavilion Books, London in July ; the second edition was published in May ; and the third edition was published in . It is also published in the U.

4: Whisky Classified: Choosing Single Malts By Flavor by David Wishart

Whisky Classified offers a pretty basic and quite extensive look into the world of Single Malt Whisky. David Wishart is very analytical in his writing so that's why I'm a bit disappointed that there's so little general knowledge about whisky and how you should enjoy it.
