SEO techniques help bring the online traffic you desire and thus enable your website to be ranked higher than millions of others in search engine results. However, it is not an easy task as search engines are now more advanced and require you to work hard to achieve the top rank. However, before you make a jump to using expert SEO techniques, here are some basic rules and elements of good SEO, that you should follow:.

If content is King, then link is Queen. Build a network of quality links around your website and remember, the purpose of link building is not quantity, but quality. One good and trustworthy link is better than a hundred links of poor quality. Search engine friendly URLs: Always clearly name the URLs with your main keywords. Also, ensure that the URLs are simple and easy to understand. Flash elements within your webpage may look pretty and fancy, but actually do little to improve SEO. Though it may add to the user experience of a website, placing it on the main navigational path of a website can hurt your SEO efforts. Is your website following these basic rules? If so, then you and your website are on the path to a successful SEO. Though the design and overall look and feel, the captivating layouts and interactive nature of these creations may be called as a treat for the senses, the truth is that they are a treat only for eyes and ears and nothing more. Thus it does not give the user a complete sense of a make-believe reality. Studies and experiments the world over has time and again proved that more than half of communication that humans are not verbal in nature. This has led to scientists increasingly trying to devise ways of being able to communicate through the other three senses namely taste, smell and touch. The professor teaching pervasive computing at the City University of London, asked this question over an iPhone to a person standing on the other side of the room as to what does the person smell? The professor agrees and tells that these instruments are selling more than units a month harbouring the era of bringing smell into the social communication platform. When the liquid in it responsible for the scent finishes you need to get another sachet as a replacement. This is not something that is new technology though, since in there was a story running on the front cover of the famous wired magazine that talked about a company called Digiscents that had come up with a USB compatible personal scent synthesizer that worked on the computer called the iSmellDigiscents. When this technology was invented back then, it looked more of a marketing pitch but is contextual nowadays with all the smartphones with ultra-high processing power and superfast connection speed bringing in all sorts of possibilities on the forefront. There are some other fun projects of his as well, like small haptic rings that can make someone else sense a squeeze on their ring if the other person squeezes theirs over the internet. This looks a lot like virtual handholding of sorts. Yet another project of his involves a device that consists of electrodes and triggers the taste receptors on tongue thus creating an artificial sense of taste in the brain. There have also been certain advancements in mobile technology with respect to installation of apps on pc without android emulator for playing that favourite mobile game on your desktop PC. Some other projects along these lines are also being carried out in the National University of Singapore that are about creating a digital lollipop that makes the tongue artificially experience the taste of salt, sweet, bitter and sour things.

Is Security Research Always Useful? Anyone involved in the computer industry likely spends some amount of time reading about the latest security issues in books such as Security for Web Developers. Administrators and developers probably spend more time than many people, but no one can possibly read all the security research available today. There are so many researchers looking for so many bugs in so many places and in so many different ways that even if someone had the time and inclination to read every security article produced, it would be impossible. Some of the attacks require physical access to the system. In some cases, you must actually take the system apart to access components in order to perform the security trick. Unless you or your organization is in the habit of allowing perfect strangers physical access to your systems, which might include taking them apart, you must wonder whether the security issue is even worth worrying about. More importantly, the moment you see that a security issue requires physical access to the device, you can probably stop reading. You also find attacks that require special equipment to perform. The article, How encryption keys could be stolen by your lunch , discusses one such attack. In fact, the article contains a picture of the special equipment that you must build to perpetrate the attack. It places said equipment into a piece of pita bread, which adds a fanciful twist to something that is already quite odd and pretty much unworkable given that you must be within 50 cm Except for the interesting attack vector using a piece of pita bread , you really have to question why anyone would ever perpetrate this attack given that social engineering and a wealth of other attacks require no special equipment, are highly successful, and work from a much longer distance. Another example of incredibly weird security research is found in the article, When the good guys are wielding the lasers. This attack at least has the advantage of distance 1 km or 0. However, you have to wonder just how the laser was able to get a line of sight with the attack object, a printer in this case. A few research pieces become more reasonable by discussing outlandish sorts of hacks that could potentially happen after an initial break-in. The hack discussed in Design flaw in Intel chips opens door to rootkits is one of these sorts of hacks. The articles that help most provide a shot of reality into the decidedly conspiracy-oriented world of security. For example, Evil conspiracy? Nope, everyday cyber insecurity , discusses a series of events that everyone initially thought pointed to a major cyber attack. It turns out that the events occurred at the same time by coincidence. The article author thoughtfully points out some of the reasons that the conspiracy theories seemed a bit out of place at the outset anyway. It also helps to know the true sources of potential security issues. These are the sorts of articles that should attract your attention because they describe a security issue that you really should think about. Critical thinking skills are your best asset when building your security knowledge. Let me know about your take on security research at [John JohnMuellerBooks](http://JohnJohnMuellerBooks).
