Either condition, particularly in the front tire, will promote shaking of the fork assembly and thus the handlebars. A sudden onset of shaking can result if a balance weight is displaced during use. Tires badly positioned on the wheel rims. A molded line on each wall of a tire is provided to allow visual verification that the tire is correctly positioned on the rim. A check can be made by rotating the tire; any misalignment will be immediately obvious. Wheel rims warped or damaged. Inspect the wheels for runout as described in Chapter 5. Swinging arm bearings worn. Steering head bearings, incorrectly adjusted. Vibration is more likely to result from bearings which are too loose rather than too tight. Loosen fork component fasteners. Loose nuts and bolts holding the fork legs, wheel spindle, mudguards or steering stem can promote shaking at the handlebars. Fasteners on running gear such as the forks and suspension should be checked and tightened occasionally to prevent dangerous looseness of components occurring. Engine mounting bolts loose. Fit a new sealing washer to the shaft retaining screw, apply thread locking compound to its threads and refit the screw, tightening it securely to a torque setting of 1. Liberally oil the clutch pushrod and insert it into the input shaft, using the wear marks on each end to ensure that the pushrod is refitted the right way round. Refit the steel ball. Oil the bush at its center, then refit the clutch outer drum, ensuring that its teeth mesh correctly with the primary drive gear and on XT models only the kickstart idler gear. Refit the thick thrust washer and the clutch center. Refit the retaining nut lock washer, noting that its smaller tab must engage with the slot in the clutch center boss. Refit the nut, lock the clutch center by the method used on dismantling, and tighten the nut to a torque setting of 5. Secure the nut by bending up against one of its flats one of the lock washer tabs and check that the clutch center and outer drum are free to rotate independently of each other. If new clutch friction plates are to be fitted, they should be coated first with a film of oil. Starting with a friction plate followed by a plain plate, build up the plates alternately to finish with a friction plate.
