*The F7 Drive is a Pulse Width Modulated Drive for AC 3-Phase induction motors. This type of Drive is also known as an Adjustable Frequency Drive, Variable Frequency Drive, AC Drive, AFD, ASD, VFD, VSD, and Inverter.*

This command changes the status of the slave station. It does not remove the cause of a fault. After the cause of the alarm or warning has been removed, this command is then used to clear the status of the alarm or warning. After the connection is established, the phase moves to phase 2 or 3. If a transfer fault is detected after moving to phase 2 or phase 3, notification is given of the fault. The setting range satisfies the following formulas. In the following cases, a warning is generated and the command is ignored. After moving to phase 1, no check for transmission faults is executed. This command can be used in phases 2 and 3. If this command is received while in phase 2 or 3, the data for the control command to the Inverter is cleared to 0, and a fault reset command is carried out for the Inverter. Fault reset INV multi-function terminal input 5 Default: Multi-step speed reference 1 INV multi-function terminal input 6 Default: Multi-step speed reference 2 INV multi-function terminal input 7 Default: Output frequency According to Frequency reference U According to INV analog input A2 0. Main circuit current voltage: After this command is issued, synchronous communications are carried out. If communications become asynchronous due to any fault such as a communications fault, this command can be used to restore synchronous communications. If a warning is generated, the values that were read are undefined. D3 to D7 are not used. Inverter fault detection and SI-T fault detection. If a warning occurs, operation will follow the previous command. Command warning Communications warning Received commands are ignored. The following table shows the alarm codes for SI-T notification if a fault is detected in the Inverter.
